Title Sequence Error Filter for Formalin-Fixed and Paraffin-Embedded Samples

Version 2.1.6

Maintainer Masachika Ikegami <ikegamitky@gmail.com>

Description Clinical sequencing of tumor is usually performed on formalin-fixed and paraffin-embedded samples and have many sequencing errors. We found that the majority of these errors are detected in chimeric read caused by single-strand DNA with micro-homology. Our filtering pipeline focuses on the uneven distribution of the artifacts in each read and removes such errors in formalin-fixed and paraffin-embedded samples without over-eliminating the true mutations detected in fresh frozen samples.

Contents

`exampleBam` *An example BAM file.*

Description

A BAM file containing the information of eight mutations.

Usage

```
exampleBam
```

Format

A list with 8 factors, each contains 46527 variables:

rname chromosome of the read

qname read ID list

seq sequence of the read, in DNAString

strand strand of the read

cigar CIGAR sequence of the read

qual Phred quality of the read

pos starting position of the read

isize insert size of the read ...

`exampleMutation` *An example mutation file.*

Description

A dataset containing the information of eight mutations.

Usage

```
exampleMutation
```

Format

A list with 8 factors, each contains 29 variables

Sample sample name

Mut_type mutation type

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

SimpleRepeat_TRF mutation locating repeat sequence

Neighborhood_sequence neighborhood sequence ...

`fun_analysis` *Analyzing function.*

Description

This function analyzes the filtering results.

Usage

```
fun_analysis(
  msec,
  mut_depth,
  short_homology_search_length,
  min_homology_search,
  threshold_p,
  threshold_hairpin_ratio,
  threshold_short_length,
  threshold_distant_homology,
  threshold_soft_clip_ratio,
  threshold_low_quality_rate,
  homopolymer_length
)
```

Arguments

`msec`	Mutation filtering information.
`mut_depth`	Mutation coverage data.
`short_homology_search_length`	Small sequence for homology search.
`min_homology_search`	The sequence length for homology search.
`threshold_p`	The largest p value of significant errors.
`threshold_hairpin_ratio`	The smallest hairpin read ratio.
`threshold_short_length`	Reads shorter than that are analyzed.
`threshold_distant_homology`	The smallest rate of reads from other regions.
`threshold_soft_clip_ratio`	The rate of soft-clipped reads.
`threshold_low_quality_rate`	The smallest rate of low quality bases.
`homopolymer_length`	The smallest length of homopolymers.

Value

msec

Examples

```
data(msec_summarized)
data(mut_depth_checked)
fun_analysis(msec = msec_summarized,
             mut_depth = mut_depth_checked,
             short_homology_search_length = 4,
             min_homology_search = 40,
             threshold_p = 10 ^ (-6),
             threshold_hairpin_ratio = 0.50,
             threshold_short_length = 0.75,
             threshold_distant_homology = 0.15,
             threshold_soft_clip_ratio = 0.50,
             threshold_low_quality_rate = 0.1,
             homopolymer_length = 15
)
```

---

fun_hairpin_check *Hairpin-structure sequence check function*

Description

This function attempts to find hairpin structure sequences.

Usage

```
fun_hairpin_check(hairpin_seq_tmp, ref_seq, hairpin_length, hair)
```

Arguments

hairpin_seq_tmp	The sequence to be checked.
ref_seq	Reference sequence around the mutation.
hairpin_length	The temporal length of hairpin sequences.
hair	The length of sequences to be checked.

Value

list(hairpin_length, whether hairpin sequences exist or not)

fun_homology *Homology check function.*

Description

This function attempts to search the homologous regions.

Usage

```
fun_homology(
  msec,
  df_distant,
  min_homology_search,
  ref_genome,
  chr_no,
  progress_bar
)
```

Arguments

msec	Mutation filtering information.
df_distant	Sequences to be checked.
min_homology_search	Minimum length to define "homologous".
ref_genome	Reference genome for the data.
chr_no	Reference genome chromosome number (human=24, mouse=22).
progress_bar	"Y": You can see the progress visually.

Value

msec

Examples

```
## Not run:
data(msec_read_checked)
data(homology_searched)
fun_homology(msec = msec_read_checked,
   df_distant = homology_searched,
   min_homology_search = 40,
   ref_genome = BSgenome.Hsapiens.UCSC.hg38::BSgenome.Hsapiens.UCSC.hg38,
   chr_no = 24,
   progress_bar = "N"
)

## End(Not run)
```

fun_load_bam *BAM file loader*

Description

This function attempts to load the BAM file.

Usage

```
fun_load_bam(bam_file)
```

Arguments

bam_file	Path of the BAM file.

Value

df_bam

Examples

```
fun_load_bam(
  system.file("extdata", "sample.bam", package = "MicroSEC")
)
```

fun_load_chr_no *Chromosome number loading function.*

Description

This function attempts to load the chromosome number.

Usage

```
fun_load_chr_no(organism)
```

Arguments

organism	Human or Mouse genome.

Value

chr_no

Examples

```
fun_load_chr_no("Human")
```

fun_load_genome *Genome loading function.*

Description

This function attempts to load the appropriate genome.

Usage

```
fun_load_genome(organism)
```

Arguments

organism	Human or Mouse genome.

Value

ref_genome

Examples

```
fun_load_genome("Human")
```

fun_load_mutation *Mutation data file loader*

Description

This function attempts to load the mutation information file.

Usage

```
fun_load_mutation(
  mutation_file,
  sample_name,
  ref_genome,
  chr_no,
  simple_repeat_list = ""
)
```

Arguments

mutation_file	Path of the mutation information file.
sample_name	Sample name.
ref_genome	Reference genome for the data.
chr_no	Reference genome chromosome number (human=24, mouse=22).
simple_repeat_list	Optional, set simple repeat bed file path.

Value

df_mutation

Examples

```
fun_load_mutation(
  system.file("extdata", "mutation_list.tsv", package = "MicroSEC"),
  "sample",
  BSgenome.Hsapiens.UCSC.hg38::BSgenome.Hsapiens.UCSC.hg38,
  24
)
```

---

fun_read_check *Read check function.*

Description

This function attempts to check the mutation profile in each read.

Usage

```
fun_read_check(
  df_mutation,
  df_bam,
  ref_genome,
  sample_name,
  read_length,
  adapter_1,
  adapter_2,
  short_homology_search_length,
  min_homology_search,
  progress_bar
)
```

Arguments

df_mutation	Mutation information.
df_bam	Data from the BAM file.
ref_genome	Reference genome for the data.
sample_name	Sample name (character)
read_length	The read length in the sequence.
adapter_1	The Read 1 adapter sequence of the library.
adapter_2	The Read 2 adapter sequence of the library.
short_homology_search_length	Small sequence for homology search.

min_homology_search
: Minimum length to define "homologous".

progress_bar
: "Y": You can see the progress visually.

Value

list(msec, homology_search, mut_depth)

Examples

```
## Not run:
data(exampleMutation)
data(exampleBam)
fun_read_check(df_mutation = exampleMutation,
df_bam = exampleBam,
ref_genome = BSgenome.Hsapiens.UCSC.hg38::BSgenome.Hsapiens.UCSC.hg38,
sample_name = "sample",
read_length = 150,
adapter_1 = "AGATCGGAAGAGCACACGTCTGAACTCCAGTCA",
adapter_2 = "AGATCGGAAGAGCGTCGTGTAGGGAAAGAGTGT",
short_homology_search_length = 4,
min_homology_search = 40,
progress_bar = "N"
)

## End(Not run)
```

---

fun_repeat_check *Repeat check function.*

Description

This function attempts to check the repetitive sequence around the mutation.

Usage

```
fun_repeat_check(rep_a, rep_b, ref_seq, ref_width, del)
```

Arguments

rep_a	The shorter sequence of Ref and Alt.
rep_b	The longer sequence of Ref and Alt.
ref_seq	Reference sequence around the mutation.
ref_width	Search length for ref_seq.
del	Insertion: 0, Deletion: 1

Value

list(pre_rep_status, post_rep_status, pre_rep_short, post_rep_short, homopolymer_status)

fun_save *Save function.*

Description

This function attempts to save the filtering results.

Usage

```
fun_save(msec, output)
```

Arguments

msec	Mutation filtering information.
output	output file name (full path).

Examples

```
## Not run:
data(msec_analyzed)
fun_save(msec = msec_analyzed,
         output = "./MicroSEC_test.tsv.gz"
)

## End(Not run)
```

fun_setting *Mutated position search function.*

Description

This function attempts to find the mutated bases in each read.

Usage

```
fun_setting(pre, post, neighbor_seq, neighbor_length, alt_length)
```

Arguments

pre	The 5' side bases of the sequence for searching.
post	The 3' side bases of the sequence for searching.
neighbor_seq	Short reference sequence around the mutation.
neighbor_length	The length from the mutation to the ends of the short reference sequence.
alt_length	The length of altered bases.

Value

list(pre_search_length, post_search_length, peri_seq_1, peri_seq_2)

`fun_summary` *Summarizing function.*

Description

This function summarizes the filtering results.

Usage

```
fun_summary(msec)
```

Arguments

`msec`	Mutation filtering information.

Value

msec

Examples

```
data(msec_homology_searched)
fun_summary(msec_homology_searched)
```

`fun_zero` *Divide function without 0/0 errors*

Description

This function attempts to divide without 0/0 errors.

Usage

```
fun_zero(a, b)
```

Arguments

`a, b`	Integers

Value

a divided by b

homology_searched *An example sequence information file.*

Description

A dataset containing the information of reads for homology search.

Usage

```
homology_searched
```

Format

A list with 7 factors, each contains 1508 variables:

sample_name sample name

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

Direction 5' (pre) or 3' (post) sequence of the mutated base

Seq sequence for homology search ...

msec_analyzed *An example mutation file.*

Description

A dataset containing the information of eight mutations processed by the fun_homology function.

Usage

```
msec_analyzed
```

Format

A list with 37 factors, each contains 29 variables

Sample sample name

Mut_type mutation type

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

SimpleRepeat_TRF mutation locating repeat sequence

Neighborhood_sequence neighborhood sequence

read_length read length

total_read number of mutation supporting reads

soft_clipped_read number of soft-clipped reads

flag_hairpin number of reads produced by hairpin structure

pre_support_length maximum 5'-supporting length

post_support_length maximum 3'-supporting length

short_support_length minimum supporting length

pre_farthest 5'-farthest supported base from the mutated base

post_farthest 3'-farthest supported base from the mutated base

low_quality_base_rate_under_q18 low quality base rate

low_quality_pre low quality base rate of 5'- side

low_quality_post low quality base rate of 3'- side

distant_homology_rate rate of reads derived from homologous regions

soft_clipped_rate rate of soft clipped reads

prob_filter_1 possibility of short-supporting length

prob_filter_3_pre possibility of 5'-supporting length

prob_filter_3_post possibility of 3'-supporting length

filter_1_mutation_intra_hairpin_loop filter 1

filter_2_hairpin_structure filter 2

filter_3_microhomology_induced_mutation filter 3

filter_4_highly_homologous_region filter 4

filter_5_soft_clipping filter 5

filter_6_simple_repeat filter 6

filter_7_mutation_at_homopolymer filter 7

filter_8_low_quality filter 8

msec_filter_123 any of filter 1-3

msec_filter_1234 any of filter 1-4

msec_filter_all any of filter 1-8

comment comment ...

`msec_homology_searched` *An example mutation file.*

Description

A dataset containing the information of eight mutations processed by the fun_homology function.

Usage

```
msec_homology_searched
```

Format

A list with 34 factors, each contains 29 variables

Sample sample name

Mut_type mutation type

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

SimpleRepeat_TRF mutation locating repeat sequence

Neighborhood_sequence neighborhood sequence

read_length read length

mut_type mutation type

alt_length length of the mutated bases

total_read number of mutation supporting reads

soft_clipped_read number of soft-clipped reads

flag_hairpin number of reads produced by hairpin structure

hairpin_length maximum length of palindromic sequences

pre_support_length maximum 5'-supporting length

post_support_length maximum 3'-supporting length

short_support_length minimum supporting length

pre_minimum_length minimum 5'-supporting length

post_minimum_length minimum 3'-supporting length

pre_farthest 5'-farthest supported base from the mutated base

post_farthest 3'-farthest supported base from the mutated base

low_quality_base_rate_under_q18 low quality base rate

low_quality_pre low quality base rate of 5'- side

low_quality_post low quality base rate of 3'- side

pre_rep_status 5'-repeat sequence length

post_rep_status 3'-repeat sequence length

homopolymer_status homopolymer sequence length

indel_status whether the mutation is indel or not

indel_length length of indel mutation

distant_homology number of reads derived from homologous regions

penalty_pre 5'-penalty score by the mapper

penalty_post 3'-penalty score by the mapper

caution comment ...

`msec_read_checked` *An example mutation file.*

Description

A dataset containing the information of eight mutations processed by the fun_read_check function.

Usage

```
msec_read_checked
```

Format

A list with 34 factors, each contains 46527 variables

Sample sample name

Mut_type mutation type

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

SimpleRepeat_TRF mutation locating repeat sequence
