Package: packDAMipd (via r-universe)

August 19, 2024

Type Package

Title Decision Analysis Modelling Package with Parameters Estimation Ability from Individual Patient Level Data

Version 1.1.0

Maintainer Sheeja Manchira Krishnan <sheejamk@gmail.com>

Description A collection of functions to construct Markov model for model-based cost-effectiveness analysis. This includes creating Markov model (both time homogenous and time dependent models), decision analysis, sensitivity analysis (deterministic and probabilistic). The package allows estimation of parameters for the Markov model from a given individual patient level data, provided the data file follows some standard data entry rules.

License GPL-3

Depends R (>= 4.3.0)

Imports readxl, stringr, data.table, reshape2, rlang, stats, lme4, survminer, SurvRegCensCov, survival, MASS, systemfit, IPDFileCheck, valueEQ5D, car, ggplot2, grDevices, lmtest, broom, effects, gvlma, methods, relaimpo, dplyr, tidyr, hash, haven, flextable, ggpubr, labelled, purrr, ISLR

Suggests knitr, rmarkdown, covr, testthat

VignetteBuilder knitr

Encoding UTF-8

LazyData true

RoxygenNote 7.3.1

Contents

`add_entries_sameuse_timepoint`

Function to get sum of entries of resource per individual at diff timepoints if same cateogry has listed multiple time for same id of participant , this method comes in handy to get the sum

---

Description

Function to get sum of entries of resource per individual at diff timepoints if same cateogry has listed multiple time for same id of participant , this method comes in handy to get the sum

Usage

```
add_entries_sameuse_timepoint(
  use_data,
  timepointcol,
  timepointval,
  idcolumn,
  result_col
)
```

Arguments

`use_data`	the data where the observations are held
`timepointcol`	columnname in the data where the timepoints are noted
`timepointval`	which time point is considered now at which the descriptive analysis is done
`idcolumn`	id for each participant
`result_col`	name of the column where the sum of entries to be saved

Value

the data with added sum of resource use

Examples

```
eg_data <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 7, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2"),
time = c(1,1,2,2), id = c(1, 1, 1, 2)))
add_entries_sameuse_timepoint(eg_data,  "time", 1, "id",
("mark_at_2"))
```

`adl_scoring.df` *adl_scoring table*

Description

adl_scoring table

Usage

```
adl_scoring.df
```

Format

A 41 by 3 dataframe

Source

created on Jan 15, 2020

`assign_parameters` *Function to assign the values of nested parameters from the parameter list*

Description

Function to assign the values of nested parameters from the parameter list

Usage

```
assign_parameters(param_list)
```

Arguments

`param_list`	list of parameters, can be nested, or can be used the list returned from define_parameters()

Details

The parameter list should be a list of parameters in the form name value pairs. If the name value pairs is given as a string it throws error as in assign_parameters(c("cost_A = 100", "a = 10")) even if you use assign_parameters(define_parameters(c("cost_A = 100","a = 10"))) but this will be ok if you use the below forms assign_list2 <- c(a = 10, cost_A = "a + 100", cost_B = 10) assign_parameters(assign_list2) OR param_list <- define_parameters(a = 10, cost_A = "a + 100", cost_B = 10) assign_list <- assign_parameters(param_list) Also for nested parameters, remember to give the parameters in order so that at run time, the parameters can be evaluated for example, assign_list = define_parameters(cost_A="a+100", a=10) assign_parameters(assign_list) will throw an error, while assign_list = define_parameters(a = 10, cost_A = "a + 100") assign_parameters(assign_list) will successfully assign parameters as the parameters 'a' is visible before the calculation of 'cost_A' Another thing to note is that while using define_parameters, just enumerate them, no need to create as a list by using c() or list function

Value

list of assigned parameters

Examples

```
param_list <- define_parameters(
  cost_direct_med_A = 1701, cost_comm_care_A = 1055,
  cost_direct_med_B = 1774, cost_comm_care_B = 1278,
  cost_direct_med_C = 6948,
  cost_comm_care_C = 2059, cost_zido = 2456, cost_health_A =
  "cost_direct_med_A + cost_comm_care_A",
  cost_health_B = "cost_direct_med_B + cost_comm_care_B",
  cost_health_C = "cost_direct_med_C + cost_comm_care_C",
  cost_drug = "cost_zido"
)
assign_parameters(param_list)
```

---

blank.df *Parameter table created*

Description

Parameter table created

Usage

```
blank.df
```

Format

A 2 column 1 observation

Source

created on September 5, 2020

`calculate_icer_nmb` *Estimation of ICER and NMB*

Description

Estimation of ICER and NMB

Usage

```
calculate_icer_nmb(list_markov, threshold, comparator = NULL)
```

Arguments

`list_markov`	list of Markov model objects with their Markov trace, cost matrix and utility matrix
`threshold`	threshold value of WTP
`comparator`	the strategy to be compared with

Value

ICER and NMB for all the strategies compared to comparator

Examples

```
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 100, utility = 1)
dead <- health_state("dead", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.6, 0.2, 0.2, 0.6, 0.4, 1),
colnames(tmat))
health_states <- combine_state(well, disabled, dead)
this.strategy <- strategy(tm, health_states, "control")
this_markov <- markov_model(this.strategy, 24, c(1000, 0, 0), c(0,0))
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 10, utility = 0.5)
dead <- health_state("dead", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.4, 0.4, 0.2, 0.6, 0.4, 1),
colnames(tmat))
health_states <- combine_state(well, disabled, dead)
this.strategy <- strategy(tm, health_states, "intervention")
sec_markov <- markov_model(this.strategy, 24, c(1000, 0, 0), c(0,0))
list_markov <- combine_markov(this_markov, sec_markov)
calculate_icer_nmb(list_markov, 20000, comparator = "control")
```

checks_markov_pick_method *Checks the input to run the Markov cycles and picks correct method*

Description

Checks the input to run the Markov cycles and picks correct method

Usage

```
checks_markov_pick_method(
  current_strategy,
  initial_state,
  discount,
  method,
  half_cycle_correction,
  startup_cost,
  startup_util,
  state_cost_only_prevalent,
  state_util_only_prevalent
)
```

Arguments

current_strategy	strategy object
initial_state	value of states initially
discount	rate of discount for costs and qalys
method	what type of half cycle correction needed
half_cycle_correction	boolean to indicate half cycle correction
startup_cost	cost of states initially
startup_util	utility of states initially if any
state_cost_only_prevalent	boolean parameter to indicate if the costs for state occupancy is only for those in the state excluding those that transitioned new. This is relevant when the transition cost is provided for eg. in a state with dialysis the cost of previous dialysis is different from the newly dialysis cases.Then the state_cost_only_prevalent should be TRUE
state_util_only_prevalent	boolean parameter to indicate if the utilities for state occupancy is only for those in the state excluding those that transitioned new.

Value

changed method name

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
tm <- populate_transition_matrix(2, tmat, c(0.5, 0.5, 0, 1))
a <- health_state("Healthy", 1, 1, 0, FALSE)
b <- health_state("Dead", 1, 0, 0, TRUE)
health_states <- combine_state(a, b)
this.strategy <- strategy(tm, health_states, "intervention")
checks_markov_pick_method(this.strategy, c(1, 0), c(0, 0),
"half cycle correction", TRUE,NULL,NULL)
```

---

checks_plot_dsa *Function to do some checks before plotting sensitivity analysis results*

Description

Function to do some checks before plotting sensitivity analysis results

Usage

```
checks_plot_dsa(
  result_dsa_control,
  plotfor,
  type,
  result_dsa_treat,
  threshold,
  comparator
)
```

Arguments

result_dsa_control	result from deterministic sensitivity analysis for first or control model
plotfor	the variable to plotfor e.g. cost, utility NMB etc
type	type of analysis, range or difference
result_dsa_treat	result from deterministic sensitivity analysis for the comparative Markov model
threshold	threshold value of WTP
comparator	the strategy to be compared with

Value

the plot variable

check_equal_columncontents_NAomitted *Function to check the equality of column contents between two data sets with omitting NA*

Description

Function to check the equality of column contents between two data sets with omitting NA

Usage

```
check_equal_columncontents_NAomitted(
  data1,
  data2,
  samecol,
  column_data1,
  column_data2
)
```

Arguments

data1	first data set
data2	second data set
samecol	a unique col in both datasets, like tno or id
column_data1	column name in data 1 to be compared
column_data2	column name in data 2 to be compared

Value

0 if they are equal else error message

Examples

```
eg_data <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 7, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2"),
time = c(1,1,2,2), id = c(1, 1, 1, 2)))
eg_data2 <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 27, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2"),
time = c(1,1,2,2), id = c(1, 1, 1, 2)))
check_equal_columncontents_NAomitted(eg_data, eg_data2, "no",
"mark_at_1","mark_at_2")
```

`check_equal_sumcolumncontents_NAomitted` *Function to check the sum of column contents between two data sets with omitting NA*

Description

Function to check the sum of column contents between two data sets with omitting NA

Usage

```
check_equal_sumcolumncontents_NAomitted(
  data1,
  data2,
  samecol,
  column_data1,
  column_data2
)
```

Arguments

`data1`	first data set
`data2`	second data set
`samecol`	a unique col in both datasets, like tno or id
`column_data1`	column name in data 1 to be compared
`column_data2`	column name in data 2 to be compared

Value

0 if they are equal else error message

Examples

```
eg_data <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 7, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2"),
time = c(1,1,2,2), id = c(1, 1, 1, 2)))
eg_data2 <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 27, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2"),
time = c(1,1,2,2), id = c(1, 1, 1, 2)))
check_equal_sumcolumncontents_NAomitted(eg_data, eg_data2, "no",
"mark_at_1","mark_at_2")
```

check_link_glm *Function to find the keyword for family of distribution in glm*

Description

Function to find the keyword for family of distribution in glm

Usage

```
check_link_glm(family, link)
```

Arguments

family	family of distribution
link	function to be used

Details

Check and get the link function for the method glm

Value

the link if they can be accepted else error

Examples

```
check_link_glm("gaussian", "identity")
```

check_list_markov_models *check the list of Markov models*

Description

check the list of Markov models

Usage

```
check_list_markov_models(list_markov)
```

Arguments

list_markov	list of Markov model objects with their Markov trace, cost matrix and utility matrix

Value

0 if success else error

Examples

```
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 100, utility = 1)
dead <- health_state("dead", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.6, 0.2, 0.2, 0.6, 0.4, 1),
colnames(tmat))
health_states <- combine_state(well, disabled, dead)
this.strategy <- strategy(tm, health_states, "example")
this_markov <- markov_model(this.strategy, 24, c(1000, 0, 0), c(0,0))
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 10, utility = 0.5)
dead <- health_state("dead", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.4, 0.4, 0.2, 0.6, 0.4, 1),
colnames(tmat))
health_states <- combine_state(well, disabled, dead)
this.strategy <- strategy(tm, health_states, "example_two")
sec_markov <- markov_model(this.strategy, 24, c(1000, 0, 0), c(0, 0))
list_markov <- combine_markov(this_markov, sec_markov)
check_list_markov_models(list_markov)
```

---

check_null_na *Function to check the variable null or NA*

Description

Function to check the variable null or NA

Usage

```
check_null_na(variable)
```

Arguments

variable	name of variable or list of variable to check

Value

-1 or -2 as error, else return 0 as success

Examples

```
var = c("a")
check_null_na(var)
```

`check_trans_prob` *Check the transition probabilities for numeric values and unity row sum*

Description

Check the transition probabilities for numeric values and unity row sum

Usage

```
check_trans_prob(trans_mat)
```

Arguments

`trans_mat`	transition matrix

Details

checking for rowsum - checks for the class of transition matrix, value of rowsum (to be 1) and numeric values

Value

0 if they add to 1 else error

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
tm <- populate_transition_matrix(2, tmat, list_prob = c(0.5, 0.5, 0, 1))
check_trans_prob(tm)
```

check_treatment_arm *Function to return treatment arm*

Description

Function to return treatment arm

Usage

```
check_treatment_arm(arm)
```

Arguments

arm	the arm of the trial

Value

0, if success -1, if failure

Examples

```
check_treatment_arm("control")
```

check_values_states *Check if the values of health states are provided*

Description

Check if the values of health states are provided

Usage

```
check_values_states(health_states)
```

Arguments

health_states	list of health_state objects

Details

This is to check if the values are numeric during the run time, else to throw an error

Value

true or false

Examples

```
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 100, utility = 1)
dead <- health_state("dead", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.6, 0.2, 0.2, 0.6, 0.4, 1))
health_states <- combine_state(well, disabled, dead)
check_values_states(health_states)
```

---

combine_markov *Join Markov model objects*

Description

Join Markov model objects

Usage

```
combine_markov(markov1, ...)
```

Arguments

markov1	object 1 of class markov_model
...	any additional objects

Details

Combining Markov models for easiness of comparison

Value

joined objects of type markov_model

Examples

```
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 100, utility = 1)
dead <- health_state("dead", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.6, 0.2, 0.2, 0.6, 0.4, 1))
health_states <- combine_state(well, disabled, dead)
this.strategy <- strategy(tm, health_states, "example")
this_markov <- markov_model(this.strategy, 24, c(1000, 0, 0))
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 10, utility = 0.5)
dead <- health_state("dead", cost = 0, utility = 0)
```

```
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.4, 0.4, 0.2, 0.6, 0.4, 1))
health_states <- combine_state(well, disabled, dead)
this.strategy <- strategy(tm, health_states, "example")
sec_markov <- markov_model(this.strategy, 24, c(1000, 0, 0))
list_markov <- combine_markov(this_markov, sec_markov)
```

`combine_state` *Join health states*

Description

Join health states

Usage

```
combine_state(...)
```

Arguments

...	any additional objects

Details

checking each state is a health state and join them

Value

joined health states

Examples

```
a <- health_state("IT", 100, 0.4, 0, FALSE)
b <- health_state("PT", 100, 0.4, 0, FALSE)
combine_state(a, b)
```

`convert_freq_diff_basis` *Convert frequency medication to given basis*

Description

Convert frequency medication to given basis

Usage

```
convert_freq_diff_basis(freq_given, basis = "day")
```

Arguments

`freq_given`	given frequency
`basis`	given basis, default is daily

Value

converted frequency

Examples

```
convert_freq_diff_basis("once daily")
convert_freq_diff_basis("bd", "week")
convert_freq_diff_basis("Every 4 days", "day")
```

`convert_to_given_timeperiod` *Convert period to given basis*

Description

Convert period to given basis

Usage

```
convert_to_given_timeperiod(given_time, basis_time = "day")
```

Arguments

`given_time`	given time
`basis_time`	given basis, default is "day"

Value

converted unit

Examples

```
convert_to_given_timeperiod("4 weeks")
convert_to_given_timeperiod("a month")
convert_to_given_timeperiod("1 week")
```

---

convert_volume_basis *Convert volume to given basis*

Description

Convert volume to given basis

Usage

```
convert_volume_basis(given_unit, basis = "ml")
```

Arguments

given_unit	given unit
basis	given basis, default is "ml"

Value

converted unit

Examples

```
convert_volume_basis("ml", "liter")
```

---

convert_weight_diff_basis *Convert unit strength to given basis*

Description

Convert unit strength to given basis

Usage

```
convert_weight_diff_basis(given_unit, basis = "mg")
```

Arguments

given_unit	given unit
basis	given basis, default is "mg"

Value

converted unit

Examples

```
convert_weight_diff_basis("mg")
convert_weight_diff_basis("kilogram", "micro gram")
```

---

convert_wtpertimediff_basis

Convert weight per time to given basis

Description

Convert weight per time to given basis

Usage

```
convert_wtpertimediff_basis(given_unit, basis = "mcg/hour")
```

Arguments

given_unit	given unit
basis	given basis, default is "mg"

Value

converted unit

Examples

```
convert_wtpertimediff_basis("mg/day")
convert_wtpertimediff_basis("mcg/day")
convert_wtpertimediff_basis("mg/hour")
```

convert_wtpervoldiff_basis

Convert wt per unit volume to given basis

Description

Convert wt per unit volume to given basis

Usage

```
convert_wtpervoldiff_basis(given_unit, basis = "mg/ml")
```

Arguments

given_unit	given unit
basis	given basis, default is "mg/ml"

Value

converted unit

Examples

```
convert_wtpervoldiff_basis("g/ml")
```

costing_AandE_admission

Function to estimate the cost of inpatient admission but taken from GP records where code or description known

Description

Function to estimate the cost of inpatient admission but taken from GP records where code or description known

Usage

```
costing_AandE_admission(
  ind_part_data,
  code_ae,
  descrip_ae,
  number_use_ae,
  type_admit_ae,
  unit_cost_data,
  code_col,
```

```
  type_admit_col,
  description_col,
  unit_cost_col,
  cost_calculated_in = "attendance",
  sheet = NULL
)
```

Arguments

ind_part_data	IPD
code_ae	column name of code (for inpatient admission)
descrip_ae	column name of description for inpatient admission
number_use_ae	the number of days spent in each admission if that is a criteria to be included. Otherwise each admission will be costed
type_admit_ae	term indicating admission and type of attendance
unit_cost_data	unit cost data file with code/descriptions and unit costs are listed for inpatient admission
code_col	code column name in unit cost data
type_admit_col	colname that describes type of the attendance and
description_col	column name of description of inpatient admission in the unit cost data
unit_cost_col	column name of unit cost in unit_cost_data
cost_calculated_in	name of unit where the cost is calculated assumed to be per admission
sheet	sheet where the unit costs are listed in the unit costs data file

Value

the calculated cost of inpatient admission long with original data

Examples

```
costs_file <- system.file("extdata",
"National_schedule_of_NHS_costs_2019_AandE.csv", package = "packDAMipd")
datafile <- system.file("extdata", "resource_use_ae_ip.csv",
package = "packDAMipd")
ind_part_data <- packDAMipd::load_trial_data(datafile)
unit_cost_data <- packDAMipd::load_trial_data(costs_file)
result <- costing_AandE_admission(ind_part_data = ind_part_data,
code_ae = "code", descrip_ae = NULL, number_use_ae = "number_use",
type_admit_ae = "type_admit", unit_cost_data = unit_cost_data,
code_col = "Currency_Code", type_admit_col = "Service_Code",
description_col = NULL, unit_cost_col ="National_Average_Unit_Cost",
cost_calculated_in = "attendance")
```

`costing_inpatient_daycase_admission` *Function to estimate the cost of inpatient admission but taken from GP records where HRG code or description known*

Description

Function to estimate the cost of inpatient admission but taken from GP records where HRG code or description known

Usage

```
costing_inpatient_daycase_admission(
  ind_part_data,
  hrg_code_ip_admi,
  descrip_ip_admi,
  number_use_ip_admi,
  elective_col,
  unit_cost_data,
  hrg_code_col,
  description_col,
  unit_cost_col,
  cost_calculated_in = "admission"
)
```

Arguments

`ind_part_data`	IPD
`hrg_code_ip_admi`	column name of hrg code (for inpatient admission)
`descrip_ip_admi`	column name of description for inpatient admission
`number_use_ip_admi`	the number of days spent in each admission if that is a criteria to be included. Otherwise each admission will be costed
`elective_col`	colname to say whether it is an elective admission or non elective admission
`unit_cost_data`	unit cost data file with hrg code/descriptions and unit costs are listed for inpatient admission
`hrg_code_col`	hrg code column name in unit cost data
`description_col`	column name of description of inpatient admission in the unit cost data
`unit_cost_col`	column name of unit cost in unit_cost_data
`cost_calculated_in`	name of unit where the cost is calculated assumed to be per admission

Value

the calculated cost of inpatient admission long with original data

Examples

```
costs_file <- system.file("extdata",
 "National_schedule_of_NHS_costs_2019.csv",
 package = "packDAMipd")
 datafile <- system.file("extdata", "resource_use_hc_ip.csv",
 package = "packDAMipd")
 ind_part_data <- packDAMipd::load_trial_data(datafile)
 unit_cost_data <- packDAMipd::load_trial_data(costs_file)

 cost_calculated_in = "admission")
```

---

costing_opioid_liquids_averageMED_long

Function to estimate the cost of liquids when IPD is in long format

---

Description

Function to estimate the cost of liquids when IPD is in long format

Usage

```
costing_opioid_liquids_averageMED_long(
  the_columns,
  ind_part_data_long,
  name_med,
  brand_med = NULL,
  bottle_size,
  bottle_size_unit = NULL,
  bottle_lasts,
  bottle_lasts_unit = NULL,
  preparation_dose,
  preparation_unit = NULL,
  timeperiod,
  unit_cost_data,
  unit_cost_column,
  cost_calculated_per,
  strength_column,
  list_of_code_names = NULL,
  list_of_code_brand = NULL,
  list_of_code_bottle_size_unit = NULL,
```

```
  list_of_code_bottle_lasts_unit = NULL,
  list_preparation_dose_unit = NULL,
  eqdose_covtab = NULL,
  basis_strength_unit = NULL
)
```

Arguments

the_columns	columns that are to be used to convert the data from long to wide
ind_part_data_long	IPD
name_med	name of medication
brand_med	brand name of medication if revealed
bottle_size	size of the bottle used
bottle_size_unit	unit of bottle volume
bottle_lasts	how long the bottle lasted
bottle_lasts_unit	time unit of how long the bottle lasted
preparation_dose	dose if preparation is given
preparation_unit	unit of preparatio dose
timeperiod	time period for cost calculation
unit_cost_data	unit costs data
unit_cost_column	column name of unit cost in unit_cost_data
cost_calculated_per	column name of unit where the cost is calculated
strength_column	column column name that has strength of medication
list_of_code_names	if names is coded, give the code:name pairs, optional
list_of_code_brand	if brand names are coded, give the code:brand pairs, optional
list_of_code_bottle_size_unit	list of bottle size units and codes
list_of_code_bottle_lasts_unit	list of time of bottle lasts and codes
list_preparation_dose_unit	list of preparation dose units and codes
eqdose_covtab	table to get the conversion factor for equivalent doses, optional
basis_strength_unit	strength unit to be taken as basis required for total medication calculations

Value

the calculated cost of tablets along with original data

Examples

```
med_costs_file <- system.file("extdata", "medicaton_costs_all.xlsx",
package = "packDAMipd")
data_file <- system.file("extdata", "medication_liq_brand_empty.xlsx",
package = "packDAMipd")

  list_of_code_names = NULL,
  list_of_code_brand = NULL,
  list_of_code_bottle_size_unit = NULL,
  list_of_code_bottle_lasts_unit = NULL,
  list_preparation_dose_unit = NULL,
  eqdose_covtab = NULL,
  basis_strength_unit = NULL
)
```

Arguments

ind_part_data	IPD
name_med	name of medication
brand_med	brand name of medication if revealed
bottle_size	size of the bottle used
bottle_size_unit	unit of bottle volume
bottle_lasts	how long the bottle lasted
bottle_lasts_unit	time unit of how long the bottle lasted
preparation_dose	dose if preparation is given
preparation_unit	unit of preparation dose
timeperiod	time period for cost calculation
unit_cost_data	unit costs data
unit_cost_column	column name of unit cost in unit_cost_data
cost_calculated_per	column name of unit where the cost is calculated
strength_column	column column name that has strength of medication
list_of_code_names	if names is coded, give the code:name pairs, optional
list_of_code_brand	if brand names are coded, give the code:brand pairs, optional
list_of_code_bottle_size_unit	list of bottle size units and codes
list_of_code_bottle_lasts_unit	list of time of bottle lasts and codes

list_preparation_dose_unit
: list of preparation dose units and codes

eqdose_covtab
: table to get the conversion factor for equivalent doses, optional, but the column names have to unique Similar to c("Drug", "form", "unit", "factor") or c("Drug", "form", "unit", "conversion")

basis_strength_unit
: strength unit to be taken as basis required for total medication calculations

Value

the calculated cost of tablets along with original data

Examples

```
med_costs_file <- system.file("extdata", "medicaton_costs_all.xlsx",
package = "packDAMipd")
data_file <- system.file("extdata", "medication_liq.xlsx",
package = "packDAMipd")

```

---

costing_resource_use *Function to estimate the cost of resource use taken (from IPD)*

Description

Function to estimate the cost of resource use taken (from IPD)

Usage

```
costing_resource_use(
  ind_part_data,
  name_use_col,
  each_length_num_use = NULL,
  each_use_provider_indicator = NULL,
  unit_length_use = "day",
  unit_cost_data,
  name_use_unit_cost,
  unit_cost_column,
  cost_calculated_in,
  list_code_use_indicator = NULL,
  list_code_provider_indicator = NULL
)
```

Arguments

ind_part_data	IPD
name_use_col	name of the column containing resource use
each_length_num_use	list of column names that shows length/number of repeated use eg. hospital admission
each_use_provider_indicator	list of column names that shows the bool indicators for the use of resource if this is to be included for the particular provider, say an nhs hospital use
unit_length_use	the column name that contains how many or how long used
unit_cost_data	unit costs data where the assumption is that the unit cost for resources such as hospital use, gp visit are listed in column resource/resource use with unit costs in another column and the units calculated as in another column
name_use_unit_cost	name of resource use (the column name in the unit cost data is assumed to be name/resource/type etc) in unit cost data
unit_cost_column	column name of unit cost in unit_cost_data
cost_calculated_in	column name of unit where the cost is calculated
list_code_use_indicator	if the column name_use_col shows codes to indicate the resource use provide the list of codes and resource use for eg., list(c("yes", "no", c(1,2)))
list_code_provider_indicator	column each_use_provider_indicator shows codes to indicate the resource use provide the list of codes and resource use for eg., list(c("yes", "no", c(1,2)))

Value

the calculated cost of resource uses along with original data

Examples

```
costs_file <- system.file("extdata", "costs_resource_use.csv",
package = "packDAMipd")
datafile <- system.file("extdata", "resource_use_hc_2.csv",
package = "packDAMipd")
ind_part_data <- load_trial_data(datafile)
unit_cost_data <- load_trial_data(costs_file)
res <- costing_resource_use(
  ind_part_data[1, ],
  "hospital_admission_1",
  list("length_1", "length_2"),
  list("nhs_1", "nhs_2"),
  "day",
  unit_cost_data, "Inpatient hospital admissions", "UnitCost",
  "UnitUsed",
  NULL, NULL
)
```

---

cost_data.df *cost matrix*

Description

cost matrix

Usage

```
cost_data.df
```

Format

A 11 by 2 dataframe

Source

created on Nov 26, 2019 from tmat <- rbind(c(1, 2), c(3, 4)) colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead") tm <- transition_matrix(2, tmat, c(0.5, 0.5, 0, 1)) a <- health_state("Healthy", 1, 1, FALSE) b <- health_state("Dead", 1, 0, TRUE) health_states <- combine_state(a, b) this.strategy <- strategy(tm, health_states, "intervention")

`create_new_dataset` *create new dataset while keeping cox regression results and returned coefficients*

Description

create new dataset while keeping cox regression results and returned coefficients

Usage

```
create_new_dataset(var, covar, dataset, categorical)
```

Arguments

`var`	variable for which the levels have to be identified usually indep variable
`covar`	the other covariates
`dataset`	the dataset where these variables contain
`categorical`	are these variables categorical? True of false

Value

new data frame

Examples

```
dataset <- survival::lung
new = create_new_dataset("status", c("age"), dataset, c(FALSE))
```

`create_shorttable_from_gtsummary_compare_twogroups_timpoints`
Create a table to compare the descriptive analysis (short) from gtsummary of two groups, but at different timepoints

Description

Create a table to compare the descriptive analysis (short) from gtsummary of two groups, but at different timepoints

Usage

```
create_shorttable_from_gtsummary_compare_twogroups_timpoints(
  variables,
  gtsummary,
  name_use,
  timepoints
)
```

Arguments

variables	variables that interested
gtsummary	a gtsummary object that contains summary parameters
name_use	name of the variable or category
timepoints	the timepoints at which the descriptive analysis is done

Value

the table

Examples

```
eg_data <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 34, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 23, 45)))
outcome_summary <- IPDFileCheck::get_summary_gtsummary(eg_data,
c("gender", "mark_at_1", "mark_at_2"), byvar = "gender")
variables <- "Mark"
k <- create_shorttable_from_gtsummary_compare_twogroups_timpoints(variables,
outcome_summary, "Category", c(1, 2))
```

---

create_table_from_gtsummary_compare_twogroups

Create a table to compare the descriptive analysis from gtsummary of two groups

---

Description

Create a table to compare the descriptive analysis from gtsummary of two groups

Usage

```
create_table_from_gtsummary_compare_twogroups(variables, gtsummary, name_use)
```

Arguments

variables	variables that interested
gtsummary	a gtsummary object that contains summary parameters
name_use	name of the variable or category

Value

the table

Examples

```
eg_data <- as.data.frame(list(no = c(1,2,3,4), mark = c(12,34,23,45),
gender = c("M", "F", "M", "F")))
outcome_summary <- IPDFileCheck::get_summary_gtsummary(eg_data,
c("gender", "mark"), byvar = "gender")
variables <- "Mark"
create_table_from_gtsummary_compare_twogroups(variables,
outcome_summary, "Category")
```

`define_parameters` *Function to return a list of parameters given*

Description

Function to return a list of parameters given

Usage

```
define_parameters(...)
```

Arguments

`...`	any parameters set of name value pairs expected

Details

To return a list of parameters For using with assign_parameters() just list or enumerate the parameters, do not use c() or list() to create a data type list

Value

a list of parameters

Examples

```
define_parameters(rr = 1)
```

`define_parameters_psa` *Define parameter lists for deterministic sensitivity analysis*

Description

Define parameter lists for deterministic sensitivity analysis

Usage

```
define_parameters_psa(base_param_list, sample_list)
```

Arguments

`base_param_list`	list of parameters that used to define Markov model
`sample_list`	list of parameter values with their sampling distributions

Value

table for probability sensitivity analysis

Examples

```
param_list <- define_parameters(
  cost_zido = 2278, cost_direct_med_A = 1701,
  cost_comm_care_A = 1055, cost_direct_med_B = 1774,
  cost_comm_care_B = 1278,
  cost_direct_med_C = 6948, cost_comm_care_C = 2059,
  tpAtoA = 1251 / (1251 + 483),
  tpAtoB = 350 / (350 + 1384), tpAtoC = 116 / (116 + 1618),
  tpAtoD = 17 / (17 + 1717),
  tpBtoB = 731 / (731 + 527), tpBtoC = 512 / (512 + 746),
  tpBtoD = 15 / (15 + 1243),
  tpCtoC = 1312 / (1312 + 437), tpCtoD = 437 / (437 + 1312), tpDtoD = 1,
  cost_health_A = "cost_direct_med_A+ cost_comm_care_A",
  cost_health_B = "cost_direct_med_B+ cost_comm_care_B",
  cost_health_C = "cost_direct_med_C+ cost_comm_care_C",
  cost_drug = "cost_zido"
)
sample_list <- define_parameters(cost_zido = "gamma(mean = 2756,
sd = sqrt(2756))")
param_table <- define_parameters_psa(param_list, sample_list)
```

`define_parameters_sens_anal` *ISLR flextable huxtable nlme tm Define parameter lists for deterministic sensitivity analysis*

Description

ISLR flextable huxtable nlme tm Define parameter lists for deterministic sensitivity analysis

Usage

```
define_parameters_sens_anal(param_list, low_values, upp_values)
```

Arguments

`param_list`	list of parameters that used to define Markov model
`low_values`	list of lower values of those parameters for whom the sensitivity is to be estimated
`upp_values`	list of upper values of those parameters for whom the sensitivity is to be estimated

Details

Get the parameter list, min and maximum values of the parameters. The min and max values should have same entries, but they should be contained in param_list too. Copy the exact values of parameters that are in param list but not in min and max values

Value

table for sensitivity analysis

Examples

```
param_list <- define_parameters(
  cost_zido = 2278, cost_direct_med_A = 1701,
  cost_comm_care_A = 1055, cost_direct_med_B = 1774,
  cost_comm_care_B = 1278,
  cost_direct_med_C = 6948, cost_comm_care_C = 2059,
  tpAtoA = 1251 / (1251 + 483),
  tpAtoB = 350 / (350 + 1384), tpAtoC = 116 / (116 + 1618),
  tpAtoD = 17 / (17 + 1717),
  tpBtoB = 731 / (731 + 527), tpBtoC = 512 / (512 + 746),
  tpBtoD = 15 / (15 + 1243),
  tpCtoC = 1312 / (1312 + 437), tpCtoD = 437 / (437 + 1312), tpDtoD = 1,
  cost_health_A = "cost_direct_med_A +  cost_comm_care_A",
  cost_health_B = "cost_direct_med_B +  cost_comm_care_B",
  cost_health_C = "cost_direct_med_C +  cost_comm_care_C",
  cost_drug = "cost_zido"
```

```
)
low_values <- define_parameters(cost_direct_med_B = 177.4,
cost_comm_care_C = 205.9)
upp_values <- define_parameters(cost_direct_med_B = 17740,
cost_comm_care_C = 20590)
param_table <- define_parameters_sens_anal(param_list, low_values,
upp_values)
```

`define_transition_table` *Define the table for transition*

Description

Define the table for transition

Usage

```
define_transition_table(tmat)
```

Arguments

`tmat`	transition matrix in the format as in package 'mstate'

Details

Generating a table for transition matrix for efficient understanding and checking The transition matrix in the format as per 'mstate' package is transformed to a table. if tmat is not a square matrix, it gives error else it spells out the transition number, probability name and from state to state

Value

the transition table with the probabilities

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
define_transition_table(tmat)
```

do_psa *Function to do probabilistic sensitivity analysis*

Description

Function to do probabilistic sensitivity analysis

Usage

```
do_psa(this_markov, psa_table, num_rep)
```

Arguments

this_markov	Markov model object
psa_table	table object from define_parameters_psa
num_rep	number of repetitions

Value

result after sensitivity analysis

Examples

```
param_list <- define_parameters(
  cost_zido = 2278, cost_direct_med_A = 1701,
  cost_comm_care_A = 1055, cost_direct_med_B = 1774,
  cost_comm_care_B = 1278,
  cost_direct_med_C = 6948, cost_comm_care_C = 2059,
  tpAtoA = 1251 / (1251 + 483),
  tpAtoB = 350 / (350 + 1384), tpAtoC = 116 / (116 + 1618),
  tpAtoD = 17 / (17 + 1717),
  tpBtoB = 731 / (731 + 527), tpBtoC = 512 / (512 + 746),
  tpBtoD = 15 / (15 + 1243),
  tpCtoC = 1312 / (1312 + 437), tpCtoD = 437 / (437 + 1312), tpDtoD = 1,
  cost_health_A = "cost_direct_med_A+ cost_comm_care_A",
  cost_health_B = "cost_direct_med_B+ cost_comm_care_B",
  cost_health_C = "cost_direct_med_C+ cost_comm_care_C",
  cost_drug = "cost_zido"
)
A <- health_state("A", cost = "cost_health_A+ cost_drug ", utility = 1)
B <- health_state("B", cost = "cost_health_B + cost_drug", utility = 1)
C <- health_state("C", cost = "cost_health_C + cost_drug", utility = 1)
D <- health_state("D", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3, 4), c(NA, 5, 6, 7), c(NA, NA, 8, 9),
c(NA, NA, NA, 10))
colnames(tmat) <- rownames(tmat) <- c("A", "B", "C", "D")
tm <- populate_transition_matrix(4, tmat, c(
  "tpAtoA", "tpAtoB", "tpAtoC", "tpAtoD",
  "tpBtoB", "tpBtoC", "tpBtoD", "tpCtoC", "tpCtoD", "tpDtoD"
```

```
), colnames(tmat))
health_states <- combine_state(A, B, C, D)
mono_strategy <- strategy(tm, health_states, "mono")

sd = sqrt(2756))")
param_table <- define_parameters_psa(param_list, sample_list)
result <- do_psa(mono_markov, param_table, 10)
```

`do_sensitivity_analysis` *Function to do deterministic sensitivity analysis*

Description

Function to do deterministic sensitivity analysis

Usage

```
do_sensitivity_analysis(this_markov, param_table)
```

Arguments

`this_markov`	Markov model object
`param_table`	table object from define_parameters_sens_anal() with parameters (base case value, lower and upper)

Value

result after sensitivity analysis

Examples

```
param_list <- define_parameters(
cost_zido = 2278, cost_direct_med_A = 1701,
cost_comm_care_A = 1055, cost_direct_med_B = 1774,

result <- do_sensitivity_analysis(mono_markov, param_table)
```

`encode_codes_data` *Function to get the codes and the corresponding entries*

Description

Function to get the codes and the corresponding entries

Usage

```
encode_codes_data(list_code_values, data_column_nos, the_data)
```

Arguments

`list_code_values`	list of codes and values, given as list of lists
`data_column_nos`	the column numbers of data to look for the entries
`the_data`	the data where to look for

Value

weight and vol units

Examples

```
data_file <- system.file("extdata", "medication_liq_codes.xlsx",
package = "packDAMipd")
ind_part_data <- load_trial_data(data_file)
data_column_nos = c(2,12)
list_of_code_names = list(c(1, 2),c("Morphine", "Oxycodone"))
encode_codes_data(list_of_code_names, data_column_nos, ind_part_data)
```

`eval_assign_trans_prob` *Attribute parameters to probabilities of transition matrix*

Description

Attribute parameters to probabilities of transition matrix

Usage

```
eval_assign_trans_prob(tm, parameter_values)
```

Arguments

`tm`	A transition matrix in the format from the package 'mstate'
`parameter_values`	name value pairs of parameter values in the probability matrix

Details

Once the transition matrix is populated, the probabilities in transition matrix gets evaluated and assigned in this function call If the entry in transition matrix is NA, replaces it with zero similarly to evaluate and assign health states, the parameter values is excepted to be a list from assign_parameter() and define_parameter(). The exception is that if the parameters are defined directly and no nested calculation is required. For eg. assign_list = c(p1 = 0.2, p2 = 0.3, p3 = 0.4, p4 = 0.5) prob <- eval_assign_trans_prob(tmat, assign_list) will work For those with nested calculations, this has to be defined as below assign_list<-assign_parameters(define_parameters(p1 = 0.2, p2 = 0.3, p3 = 0.4, p4 = 0.5)) prob <- eval_assign_trans_prob(tmat, assign_list) The below will give error assign_list <- c(p1=0.1, p2 = "p1 + 0.2", p3=0, p4=0.3) prob <- eval_assign_trans_prob(tmat, assign_list)

Value

the transition table with the probabilities

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
tmat <- populate_transition_matrix(2, tmat,
list_prob = c("p1", "p2", "p3", "p4"))
tmat_assigned <- eval_assign_trans_prob(tmat,
c(p1 = 0.2, p2 = 0.3, p3 = 0.4, p4 = 0.5))
```

---

eval_assign_values_states

Attribute values in health states

Description

Attribute values in health states

Usage

```
eval_assign_values_states(health_states, assigned_param)
```

Arguments

health_states	list of health_state objects
assigned_param	name value pairs of parameter values in the probability matrix expected created using function assign_parameters()

Details

Assigning the param is done for the cost and utility if the param is not numeric, check if it can be evaluated at the run time if yes, assign the evaluated numeric value if not get the parameters between operators, and assign the values to each individual parameters and then evaluate. only works for two levels. For the example shown the cost is sum of cost_A and cost_B which will only get added in the call eval_assign_values_states While initialising the state "well" it will be only saved as expression(cost_A + cost_B) assigned_param (a list) can be expected to be created using assign_parameters() the exception is if parameter is directly assigned with no nested calculation and no missing parameters. For example assigned_param = c(cost_a = 10, cost_b=10) will be ok but not assigned_param = c(a=10, cost_A = "a+100", cost_B =10) as it requires a nested calculation then use define_parameters() with assign_parameters() as in param_list <- define_parameters(a = 10, cost_A = "a + 100", cost_B = 10) assign_list <- assign_parameters(param_list)

Value

health states with assigned values

Examples

```
well <- health_state("well", cost = "cost_A + cost_B", utility = 1)
disabled <- health_state("disabled", cost = 100, utility = 1)
dead <- health_state("dead", cost = 0, utility = 0)
tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.6, 0.2, 0.2, 0.6, 0.4, 1))
health_states <- combine_state(well, disabled, dead)
eval_assign_values_states(health_states, c(cost_A = 100, cost_B = 11))
```

---

find_glm_distribution *Function to find the keyword for family of distribution in glm*

Description

Function to find the keyword for family of distribution in glm

Usage

```
find_glm_distribution(text)
```

Arguments

text	distribution

Details

Find the family for glm method

Value

the keyword - the name of distribution

Examples

```
find_glm_distribution("gamma")
```

find_keyword_rand_generation

Function to find the keyword for generating random numbers the distribution

Description

Function to find the keyword for generating random numbers the distribution

Usage

```
find_keyword_rand_generation(text)
```

Arguments

text	name of the probability distribution

Details

This function returns the keyword for generating random number using a keyword provided that is generally used for prob distribution (but R might require a different keyword)

Value

the keyword that should be used in R for generating random numbers

Examples

```
find_keyword_rand_generation("gamma")
```

find_keyword_regression_method

Function to find the keyword for regression methods

Description

Function to find the keyword for regression methods

Usage

```
find_keyword_regression_method(text, additional_info = NA)
```

Arguments

text	regression method
additional_info	additional information required

Details

This function returns the keyword to use in regression methods. For example linear regression requires lm in R some regression methods require additional info and it has to be provided

Value

the keyword that should be used in R for regression analysis

Examples

```
find_keyword_regression_method("linear")
```

---

find_parameters_btn_operators

Function to return parameters with in a expression containing operators

---

Description

Function to return parameters with in a expression containing operators

Usage

```
find_parameters_btn_operators(expr)
```

Arguments

expr	an expression

Details

This function returns the parameters between the operators if the state value or probabilities are defined as expressions, we need to extract the parameters and then assign First the position of all operators are found and then return the parameters separated by those operators This happens only for one level find_parameters_btn_operators("a+b") provides a and b but for find_parameters_btn_operators("mean(a,b)+b") provides mean(a,b) and b

Value

parameters in the expression expr

Examples

```
find_parameters_btn_operators("a+b")
```

`find_required_parameter_combs` *Function to find the parameters that determine the probability distribution*

Description

Function to find the parameters that determine the probability distribution

Usage

```
find_required_parameter_combs(name_distri)
```

Arguments

`name_distri`	name of the probability distribution

Details

For each of the probability distribution we require certain parameters and this function provides that required list of parameters.

Value

the parameters that determine the distribution

Examples

```
find_required_parameter_combs("gamma")
```

`find_rowwise_sum_multiplecol` *Function to get sum of multiple columns of observations*

Description

Function to get sum of multiple columns of observations

Usage

```
find_rowwise_sum_multiplecol(the_data, colnames, sumcolname)
```

Arguments

`the_data`	the data where the observations are held
`colnames`	columnname in the data whose sum to be obtianed
`sumcolname`	name of the new column where sum to be saved

Value

the data with added sum

Examples

```
eg_data <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 7, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2"),
time = c(1,1,2,2), id = c(1, 1, 1, 2)))
find_rowwise_sum_multiplecol(eg_data, c("mark_at_1","mark_at_2"),
"totalmarks")
```

---

find_survreg_distribution

Function to find the keyword for survreg distribution

Description

Function to find the keyword for survreg distribution

Usage

```
find_survreg_distribution(text)
```

Arguments

text	distribution

Details

For surveg method, find the distribution

Value

the keyword - the name of distribution

Examples

```
find_survreg_distribution("weibull")
```

`form_expression_glm` *Form expression to use with glm()*

Description

Form expression to use with glm()

Usage

```
form_expression_glm(
  param_to_be_estimated,
  indep_var,
  family,
  covariates,
  interaction,
  naaction,
  link
)
```

Arguments

`param_to_be_estimated`	parameter of interest
`indep_var`	the independent variable (column name in data file)
`family`	distribution name eg. for logistic regression -binomial
`covariates`	list of covariates
`interaction`	boolean value to indicate interaction in the case of generalised linear models, false by default
`naaction`	action to be taken with the missing values
`link`	link function if not the default for each family

Details

Form expression for the method glm

Value

the formula for glm

Examples

```
formula <- form_expression_glm("admit",
  indep_var = "gre", family = "binomial",
  covariates = c("gpa", "rank"), interaction = FALSE, naaction = "na.omit",
  link = NA)
```

`form_expression_lm` *Form expression to use with lm()*

Description

Form expression to use with lm()

Usage

```
form_expression_lm(param_to_be_estimated, indep_var, covariates, interaction)
```

Arguments

`param_to_be_estimated`	parameter of interest
`indep_var`	the independent variable (column name in data file)
`covariates`	list of covariates
`interaction`	boolean value to indicate interaction in the case of linear regression, false by default

Details

This function helps to create the expression for liner regression model it takes care of covariates and interaction

Value

the formula for lm

Examples

```
formula <- form_expression_lm("gre", indep_var = "gpa", covariates = NA,
interaction = FALSE)
```

`form_expression_mixed_model_lme4` *Form expression to use with mixed models*

Description

Form expression to use with mixed models

Usage

```
form_expression_mixed_model_lme4(
  param_to_be_estimated,
  dataset,
  fix_eff,
  fix_eff_interact_vars,
  random_intercept_vars,
  nested_intercept_vars_pairs,
  cross_intercept_vars_pairs,
  uncorrel_slope_intercept_pairs,
  random_slope_intercept_pairs,
  family,
  link
)
```

Arguments

`param_to_be_estimated`	column name of dependent variable
`dataset`	a dataframe
`fix_eff`	names of variables as fixed effect predictors
`fix_eff_interact_vars`	if interaction -true
`random_intercept_vars`	names of variables for random intercept
`nested_intercept_vars_pairs`	those of the random intercept variables with nested effect
`cross_intercept_vars_pairs`	those of the random intercept variables with crossed effect
`uncorrel_slope_intercept_pairs`	variables with correlated intercepts
`random_slope_intercept_pairs`	random slopes intercept pairs - this is a list of paired variables
`family`	family of distribution for non gaussian distribution of predicted variable
`link`	link function for the variance

Details

Form the expression for mixed model

Value

result regression result with plot if success and -1, if failure

Examples

```
datafile <- system.file("extdata", "data_linear_mixed_model.csv",
package = "packDAMipd")
dt = utils::read.csv(datafile, header = TRUE)
formula <- form_expression_mixed_model_lme4("extro",
  dataset = dt,
  fix_eff = c("open", "agree", "social"),
  fix_eff_interact_vars = NULL,
  random_intercept_vars = c("school", "class"),
  nested_intercept_vars_pairs = list(c("school", "class")),
  cross_intercept_vars_pairs = NULL,
  uncorrel_slope_intercept_pairs = NULL,
  random_slope_intercept_pairs = NULL, family = "binomial", link = NA
)
```

---

generate_wt_time_units

Function to get the weight and time units

Description

Function to get the weight and time units

Usage

```
generate_wt_time_units()
```

Value

weight and time units

Examples

```
ans <- generate_wt_time_units()
```

---

generate_wt_vol_units *Function to get the weight and volume units*

Description

Function to get the weight and volume units

Usage

```
generate_wt_vol_units()
```

Value

weight and vol units

Examples

```
ans <- generate_wt_vol_units()
```

`get_age_details` *Function to get the details of the age column*

Description

Function to get the details of the age column

Usage

```
get_age_details(trialdata)
```

Arguments

`trialdata`	data containing individual level trial data

Details

expecting the data contains the information on age preferably column names "age", "dob" or "yob" or "date of birth". "year of birth", "birth year" If multiple column names match these, then first match will be chosen.

Value

the name of the variable related to age and the unique contents if success, else error

Examples

```
get_age_details(data.frame("Age" = c(21, 15),
"arm" = c("control", "intervention")))
```

get_colnames_codedvalues

Function to keep the column name, coded values and non response code into a dataframe

Description

Function to keep the column name, coded values and non response code into a dataframe

Usage

```
get_colnames_codedvalues(variable, name, code, nrcode = NA)
```

Arguments

variable	name of the variable in the column
name	column name
code	coded values
nrcode	code for non response

Value

data frame with all the above information

Examples

```
get_colnames_codedvalues("arm", "pat_trial_arm", c("Y", "N"))
```

get_cost_AandE_code

Function to extract the unit hospital inpatient admission by matching code

Description

Function to extract the unit hospital inpatient admission by matching code

Usage

```
get_cost_AandE_code(
  code,
  type_admit,
  ref_cost_data_file,
  col_name_code,
  unit_cost_col,
  type_admit_col,
  sheet = NULL
)
```

Arguments

code	code for AE attendance
type_admit	term indicating admission and type of attendance
ref_cost_data_file	file that has unit cost
col_name_code	name of the column that has the code
unit_cost_col	name of the column with the unit cost
type_admit_col	colname that describes type of the attendance and that indicates admitted or not
sheet	sheet if excel file is given

Value

unit cost the unit cost matching the code

Examples

```
ref_cost_data_file <- system.file("extdata",
"National_schedule_of_NHS_costs_2019_AandE.csv", package = "packDAMipd")
re = get_cost_AandE_code("VB02Z", "T01A", ref_cost_data_file,
"Currency_Code","National_Average_Unit_Cost", "Service_Code")
```

---

get_cost_AandE_description

Function to extract the unit cost by descirption of AandE att matching description

---

Description

Function to extract the unit cost by descirption of AandE att matching description

Usage

```
get_cost_AandE_description(
  description,
  type_admit,
  ref_cost_data_file,
  col_name_description,
  unit_cost_col,
  type_admit_col,
  sheet = NULL
)
```

Arguments

description	description of the AE attendance
type_admit	term indicating admission and type of attendance
ref_cost_data_file	file that has unit cost
col_name_description	name of the column that has the description
unit_cost_col	name of the column with the unit cost
type_admit_col	colname that descirbes type of the attendance and
sheet	sheet if excel file is given

Value

unit cost the unit cost matching the hrg code

Examples

```
ref_cost_data_file <- system.file("extdata",
"National_schedule_of_NHS_costs_2019_AandE.csv", package = "packDAMipd")
re = get_cost_AandE_description("Emergency Medicine", "T01A",
ref_cost_data_file, "Currency_Description", "National_Average_Unit_Cost",
"Service_Code")
```

---

get_cost_ip_dc_description

Function to extract the unit hospital inpatient admission by matching description

---

Description

Function to extract the unit hospital inpatient admission by matching description

Usage

```
get_cost_ip_dc_description(
  description,
  ref_cost_data_file,
  col_name_description,
  unit_cost_col,
  sheet = NULL
)
```

Arguments

description	description corresponding to the inpatient admission
ref_cost_data_file	file that has unit cost
col_name_description	name of the column that has the description
unit_cost_col	name of the column with the unit cost
sheet	sheet if excel file is given

Value

unit cost the unit cost matching the hrg code

Examples

```
ref_cost_data_file <- system.file("extdata",
"National_schedule_of_NHS_costs_2019.csv", package = "packDAMipd")
result <- get_cost_ip_dc_description("Cerebrovascular Accident",
ref_cost_data_file, "Currency_Description",
"National_Average_Unit_Cost")
```

---

get_cost_ip_dc_hrg *Function to extract the unit hospital inpatient admission by matching HRG code*

Description

Function to extract the unit hospital inpatient admission by matching HRG code

Usage

```
get_cost_ip_dc_hrg(
  hrg,
  ref_cost_data_file,
  col_name_hrg_code,
  unit_cost_col,
  sheet = NULL
)
```

Arguments

hrg	hrg code corresponding to the inpatient admission
ref_cost_data_file	file that has unit cost
col_name_hrg_code	name of the column that has the hrg code
unit_cost_col	name of the colum with the unit cost
sheet	sheet if excel file is given

Value

unit cost the unit cost matching the hrg code

Examples

```
ref_cost_data_file <- system.file("extdata",
"National_schedule_of_NHS_costs_2019.csv", package = "packDAMipd")
get_cost_ip_dc_hrg("AA22C", ref_cost_data_file, "Currency_Code",
"National_Average_Unit_Cost")
```

---

get_doses_combination *Convert the combined dose to its individual component numerical value or can be unit/unit*

Description

Convert the combined dose to its individual component numerical value or can be unit/unit

Usage

```
get_doses_combination(the_string, separator = "/")
```

Arguments

the_string	given combined unit
separator	given character for separation , default is "/"

Value

separated texts

Examples

```
get_doses_combination("g/ml")
```

get_doses_combination_units

Convert the combined dose to its individual component numerical value and units

Description

Convert the combined dose to its individual component numerical value and units

Usage

```
get_doses_combination_units(the_string, separator = "/")
```

Arguments

the_string	given combined unit
separator	given character for separation , default is "/"

Value

separated numerical value and its units

Examples

```
get_doses_combination_units("10g/2ml")
```

get_eq5d_details

Function to get the details of the EQ5D column

Description

Function to get the details of the EQ5D column

Usage

```
get_eq5d_details(trialdata)
```

Arguments

trialdata	data containing individual level trial data

Details

Specific to the EQ5D data - the column names are given as certain sets, Tried to give 15 sets as the column names

Value

the name of the variable related to EQ5D and the unique contents if success, else error

Examples

```
get_eq5d_details(data.frame(
  "MO" = c(1, 2), "SC" = c(1, 2), "UA" = c(1, 2),
  "PD" = c(1, 2), "AD" = c(1, 2)
))
```

---

get_extension_file *Function to get extension of a file name*

Description

Function to get extension of a file name

Usage

```
get_extension_file(filename)
```

Arguments

filename	name of a file

Details

if there is no "." character returns error else returns last characters those after string split using "."

Value

the extension

Examples

```
get_extension_file("data.txt")
```

get_gender_details *Function to get the details of the gender column*

Description

Function to get the details of the gender column

Usage

```
get_gender_details(trialdata)
```

Arguments

trialdata	data containing individual level trial data

Details

expecting the data contains the information on gender preferably column names "gender", "sex" or "male" or "female". If multiple column names match these, then first match will be chosen.

Value

the name of the variable related to gender and the unique contents if success, else error

Examples

```
get_gender_details(data.frame("Age" = c(21, 15), "sex" = c("m", "f")))
```

get_mean_sd_age *Function to return mean age from a data frame*

Description

Function to return mean age from a data frame

Usage

```
get_mean_sd_age(this_data, age_nrcode)
```

Arguments

this_data	the data containing column with age
age_nrcode	non response code

Details

Age data is complete with the nr code given and get the mean and sd

Value

mean and sd, if success -1, if failure

Examples

```
this_data <- as.data.frame(cbind(num = c(1, 2, 3, 4),
age = c(14, 25, 26, 30)))
get_mean_sd_age(this_data, NA)
```

---

get_mortality_from_file

Get the mortality rate values from reading a file

Description

Get the mortality rate values from reading a file

Usage

```
get_mortality_from_file(paramfile, age, mortality_colname, gender = NULL)
```

Arguments

paramfile	parameter file to get the mortality eg.national life table data
age	age to get the age specific data
mortality_colname	column name with the mortality rates if it is not gender specific
gender	gender details to get the gender specific mortality data

Details

Provides the mortality rates as age and gender dependent Assumes the data contains mortality rate for single year and once it extracted per gender will retrieve single value Age column can consists of range of values, or a particular value also assumes that the mortality rate for each gender is listed under the gender column for gender specific values. if the mortality is not gender specific, the column name should be passed on to the function if gender is not null, mortality_name will be ignored

Value

the paramvalue

Examples

```
paramfile <- system.file("extdata", "LifeTable_USA_Mx_2015.csv",
  package = "packDAMipd"
)
a <- get_mortality_from_file(paramfile, age = 10, mortality_colname =
"total", gender = NULL)
```

get_name_value_probdistrb_def

Function to return the two parameters from a given expression separated by comma,

Description

Function to return the two parameters from a given expression separated by comma,

Usage

```
get_name_value_probdistrb_def(expr)
```

Arguments

expr	an expression

Details

It will return the parameters of the distribution separated by commas and given in usual notation as brackets. It will identify those in between first occurrence of "("and last occurrence of ")" and from the characters in between search for comma to indicate different parameters then it will extract (from those extracted parameters separated by commas) that on the left side of "equal" sign get_name_value_probdistrb_def("gamma(mean = sqrt(2), b =17)") will be ok but get_name_value_probdistrb_def("gamma(shape, scale")) and get_name_value_probdistrb_def("gamma(shape =1 & scale =1")) will show error

Value

parameters in the expression expr

Examples

```
get_name_value_probdistrb_def("gamma(mean = 10, sd =1)")
```

get_outcome_details

Function to get the details of the outcome column

Description

Function to get the details of the outcome column

Usage

```
get_outcome_details(trialdata, name, related_words, multiple = FALSE)
```

Arguments

`trialdata`	data containing individual level trial data
`name`	name of the variable
`related_words`	probable column names
`multiple`	indicates true if there are multiple columns

Details

if the words related to outcome is given, the function will get the columns and the codes used for the outcome, the difference here is that certain outcomes can be distributed in multiple columns

Value

the name of the variable related to health outcome (any) and the unique contents if success, else error

Examples

```
get_outcome_details(
  data.frame("qol.MO" = c(1, 2), "qol.PD" = c(1, 2), "qol.AD" = c(1, 2)),
  "eq5d", "qol", TRUE
)
```

`get_parameter_def_distribution` *Get the definition of given parameter distribution defined in a file*

Description

Get the definition of given parameter distribution defined in a file

Usage

```
get_parameter_def_distribution(
  parameter,
  paramfile,
  colnames_paramdistr,
  strategycol = NA,
  strategyname = NA
)
```

Arguments

parameter	parameter of interest
paramfile	data file to be provided
colnames_paramdistr	list of column names for the parameters that define the distribution
strategycol	treatment strategy column name
strategyname	treatment strategy name in the column strategycol

Details

This function reads the parameter distribution from a file and return the parameter obtained This assumes that the file contains parameter, distribution colnames for parameter values for the distribution are passed on to the function assumes the name of each parameter and value are given in the consecutive columns. Once the expression is created using the parameters given in the file, it gets checked for correctness of specifying the distribution in R context using the function check_estimate_substitute_proper_params and then evaluated.

Value

the definition of parameter from the given distribution

Examples

```
paramfile <- system.file("extdata", "table_param.csv",
package = "packDAMipd")
a <- get_parameter_def_distribution("rr", paramfile, c("Param1_name",
"Param1_value"))
```

---

get_parameter_direct *Get the parameter values from reading a file*

Description

Get the parameter values from reading a file

Usage

```
get_parameter_direct(parameter, paramvalue)
```

Arguments

parameter	parameter of interest
paramvalue	parameter value to be assigned

Details

Basic function to assign a parameter directly

Value

the paramvalue

Examples

```
a <- get_parameter_direct("cost_IT", paramvalue = 100)
```

`get_parameter_estimated_regression` *Get the parameter values using the provided statistical regression methods*

Description

Get the parameter values using the provided statistical regression methods

Usage

```
get_parameter_estimated_regression(
  param_to_be_estimated,
  data,
  method,
  indep_var,
  info_get_method = NA,
  info_distribution = NA,
  covariates = NA,
  timevar_survival = NA,
  interaction = FALSE,
  fix_eff = NA,
  fix_eff_interact_vars = NA,
  random_intercept_vars = NA,
  nested_intercept_vars_pairs = NA,
  cross_intercept_vars_pairs = NA,
  uncorrel_slope_intercept_pairs = NA,
  random_slope_intercept_pairs = NA,
  naaction = "stats::na.omit",
  param2_to_be_estimated = NA,
  covariates2 = NA,
  interaction2 = FALSE,
  link = NA,
  cluster_var = NA,
  package_mixed_model = NA
)
```

Arguments

`param_to_be_estimated`	parameter of interest
`data`	data to be provided or the data file containing dataset
`method`	method of estimation (for example, linear, logistic regression etc)
`indep_var`	the independent variable (column name in data file)
`info_get_method`	additional information on methods e.g Kaplan-Meier ot hazard
`info_distribution`	distribution name eg. for logistic regression -binomial
`covariates`	list of covariates-calculations to be done before passing
`timevar_survival`	time variable for survival analysis
`interaction`	boolean value to indicate interaction in the case of linear regression
`fix_eff`	boolean value to indicate interaction in the case of linear regression
`fix_eff_interact_vars`	boolean value to indicate interaction in the case of linear regression
`random_intercept_vars`	boolean value to indicate interaction in the case of linear regression
`nested_intercept_vars_pairs`	boolean value to indicate interaction in the case of linear regression
`cross_intercept_vars_pairs`	boolean value to indicate interaction in the case of linear regression
`uncorrel_slope_intercept_pairs`	boolean value to indicate interaction in the case of linear regression
`random_slope_intercept_pairs`	boolean value to indicate interaction in the case of linear regression
`naaction`	what action to be taken for the missing values, default is a missing value.
`param2_to_be_estimated`	parameter of interest for equation 2 in bivariate regression
`covariates2`	list of covariates - for equation 2 in bivariate regression
`interaction2`	boolean value to indicate interaction for equation 2 in bivariate regression
`link`	link function to be provided if not using the default link for each of the info_distribution
`cluster_var`	cluster variable if any
`package_mixed_model`	package to be used for mixed model ie nlme or lme4

Details

This function is the top in the layer of functions used for regression analysis Thus it contains many parameters to be passed on The required ones are parameter to be estimated, data that contains the observation, the method of regression to be used, the independent variable and the information for the distribution and method. if the data is given as a file name. it will load the data in that file Then it calls the appropriate functions depending on the regression method that specified. The methods that are considered : Survival analysis, linear regression, logistic regression,generalised linear model, linear multilevel or mixed model, and seemingly unrelated regression

Value

results the results of the regression analysis

Examples

```
result <- get_parameter_estimated_regression(
  param_to_be_estimated = "Direction",
  data = ISLR::Smarket, method = "logistic", indep_var = "Lag1",
  info_get_method = NA, info_distribution = "binomial",
  covariates = c("Lag2", "Lag3"), interaction = FALSE,
  naaction = "na.omit", link = NA)
```

---

get_parameter_read *Get the parameter values from reading a file*

Description

Get the parameter values from reading a file

Usage

```
get_parameter_read(parameter, paramfile, strategycol = NA, strategyname = NA)
```

Arguments

parameter	parameter of interest
paramfile	parameter file to be provided
strategycol	treatment strategy
strategyname	treatment strategy name in the column strategycol

Details

This function read the parameter from a file given that the file has these column names (at least) Parameter and Value Strategy col and name are optional. Check if the data file contains column names parameter and value and then get the results.

Value

the paramvalue

Examples

```
a <- get_parameter_read("cost_IT", paramfile = system.file("extdata",
"table_param.csv", package = "packDAMipd"))
```

get_single_col_multiple_pattern *Function to get cols for the pattern given*

Description

Function to get cols for the pattern given

Usage

```
get_single_col_multiple_pattern(pattern, the_data)
```

Arguments

pattern	the pattern to look for
the_data	data where to look at

Value

zero or -1

Examples

```
the_data <- as.data.frame(cbind(c("one", "two"), c("a", "b"), c("aa", "bb")))
colnames(the_data) <- c("name", "brand_one", "two")
get_single_col_multiple_pattern(c("brand", "trade"), the_data)
```

get_slope_intercept *help function to keep slope and intercept portion ready in mixed model expression*

Description

help function to keep slope and intercept portion ready in mixed model expression

Usage

```
get_slope_intercept(
  expression,
  random_intercept_vars,
  random_slope_intercept_pairs,
  uncorrel_slope_intercept_pairs
)
```

Arguments

`expression`	expression created so far
`random_intercept_vars`	names of variables for random intercept
`random_slope_intercept_pairs`	random slopes intercept pairs this is a list of paired variables
`uncorrel_slope_intercept_pairs`	variables with correlated intercepts

Value

expression expression created

`get_slope_intercept_cross` *help function to keep slope and intercept portion ready in mixed model expression*

Description

help function to keep slope and intercept portion ready in mixed model expression

Usage

```
get_slope_intercept_cross(
  expression,
  random_intercept_vars,
  intercept_vars_pairs,
  random_slope_intercept_pairs,
  uncorrel_slope_intercept_pairs
)
```

Arguments

`expression`	expression created so far
`random_intercept_vars`	names of variables for random intercept
`intercept_vars_pairs`	those of the random intercept variables with nested effect
`random_slope_intercept_pairs`	random slopes intercept pairs this is a list of paired variables
`uncorrel_slope_intercept_pairs`	variables with correlated intercepts

Value

expression expression created

get_slope_intercept_nested *help function to keep slope and intercept portion ready in mixed model expression*

Description

help function to keep slope and intercept portion ready in mixed model expression

Usage

```
get_slope_intercept_nested(
  expression,
  random_intercept_vars,
  intercept_vars_pairs,
  random_slope_intercept_pairs,
  uncorrel_slope_intercept_pairs
)
```

Arguments

expression	expression created so far
random_intercept_vars	names of variables for random intercept
intercept_vars_pairs	those of the random intercept variables with nested effect
random_slope_intercept_pairs	random slopes intercept pairs this is a list of paired variables
uncorrel_slope_intercept_pairs	variables with correlated intercepts

Value

expression expression created

get_timepoint_details *Function to get the details of the time point column*

Description

Function to get the details of the time point column

Usage

```
get_timepoint_details(trialdata)
```

Arguments

trialdata	data containing individual level trial data

Details

expecting the data contains the information on timepoints preferably column names "time point", "times" or "time" or "timepoint". If multiple column names match these, then first match will be chosen.

Value

the name of the variable related to time point and the unique contents if success, else error

Examples

```
get_timepoint_details(data.frame("time" = c(21, 15),
"arm" = c("control", "intervention")))
```

---

get_trial_arm_details *Function to get the details of the trial arm*

Description

Function to get the details of the trial arm

Usage

```
get_trial_arm_details(trialdata)
```

Arguments

trialdata	data containing individual level trial data

Details

expecting the data contains the information on trial arm preferably column names "arm", "trial" or "trial arm". If multiple column names match these, then first match will be chosen.

Value

the name of the variable related to trial arm and the unique contents if success, else error

Examples

```
get_trial_arm_details(data.frame(
  "Age" = c(21, 15),
  "arm" = c("control", "intervention")
))
```

get_var_state *Get the attribute for the health state*

Description

Get the attribute for the health state

Usage

```
get_var_state(state, var)
```

Arguments

state	object of class health state
var	attribute of the health state

Details

After checking the given state is a health state and given variable is defined in the health state, the value of the variable is returned

Value

modified health state

Examples

```
get_var_state(health_state("IT", 100, 0.4, 0, FALSE), "cost")
```

health_state *Definition of health state class or health state constructor*

Description

Definition of health state class or health state constructor

Usage

```
health_state(name, cost, utility, state_time = 0, absorb = FALSE)
```

Arguments

name	name of the health state
cost	value or expression that represents cost of the health state
utility	value or expression that represents utility of the health state
state_time	time denoting how long in the state
absorb	boolean indicating health state absorbing or not

Details

Initialising the name, cost, utility and time spent for the health state name is the name of the health state cost/utility can be defined as characters e.g. "cost_A" if they are characters, the value is assigned after parsing the text. state_time is integer and absorb is boolean

Value

value of the state

Examples

```
st <- health_state("IT", 100, 0.4, 0, FALSE)
st <- health_state("IT", "cost_A", 0.4, 0, FALSE)
```

---

init_trace *Define an all zero trace matrix*

Description

Define an all zero trace matrix

Usage

```
init_trace(health_states, cycles)
```

Arguments

health_states	health states
cycles	no of cycles

Details

Initialise the trace matrix with all zeros trace matrix will be with no_cycles+1 by no_states matrix

Value

trace matrix -all zero

Examples

```
a <- health_state("Healthy", 1, 1, 0, FALSE)
b <- health_state("Dead", 1, 0.5, 0, FALSE)
health_states <- combine_state(a, b)
init_trace(health_states, 10)
```

init_trace_sjtime *Define an all zero trace matrix*

Description

Define an all zero trace matrix

Usage

```
init_trace_sjtime(health_states, cycles)
```

Arguments

health_states	health states
cycles	no of cycles

Details

Initialise the trace matrix with all zeros trace matrix will be with no_cycles+1 by no_states matrix

Value

trace matrix -all zero

Examples

```
a <- health_state("Healthy", 1, 1, 0, FALSE)
b <- health_state("Dead", 1, 0.5, 0, FALSE)
health_states <- combine_state(a, b)
init_trace(health_states, 10)
```

keep_results_plot_dsa *Function to do some checks before plotting sensitivity analysis results*

Description

Function to do some checks before plotting sensitivity analysis results

Usage

```
keep_results_plot_dsa(
  result_dsa_control,
  plotfor,
  result_dsa_treat,
  plot_variable,
  threshold,
  comparator
)
```

Arguments

result_dsa_control	result from deterministic sensitivity analysis for first or control model
plotfor	the variable to plotfor e.g. cost, utility NMB etc
result_dsa_treat	result from deterministic sensitivity analysis for the comparative Markov model
plot_variable	variable for plotting
threshold	threshold value of WTP
comparator	the strategy to be compared with

Value

results to plot dsa

---

list_paramwise_psa_result

Function to list probabilistic sensitivity analysis results parameterwise

---

Description

Function to list probabilistic sensitivity analysis results parameterwise

Usage

```
list_paramwise_psa_result(
  result_psa_params_control,
  result_psa_params_treat,
  threshold,
  comparator
)
```

Arguments

result_psa_params_control	result from probabilistic sensitivity analysis for first or control model
result_psa_params_treat	result from probabilistic sensitivity analysis for the comparative Markov model
threshold	threshold value of WTP
comparator	the strategy to be compared with

Value

plot of sensitivity analysis

Examples

```
param_list <- define_parameters(
  cost_zido = 2278, cost_direct_med_A = 1701,
  cost_comm_care_A = 1055, cost_direct_med_B = 1774,
  cost_comm_care_B = 1278,
  cost_direct_med_C = 6948, cost_comm_care_C = 2059,
  tpAtoA = 1251 / (1251 + 483),
  tpAtoB = 350 / (350 + 1384), tpAtoC = 116 / (116 + 1618),
  tpAtoD = 17 / (17 + 1717),
  tpBtoB = 731 / (731 + 527), tpBtoC = 512 / (512 + 746),
  tpBtoD = 15 / (15 + 1243),
  tpCtoC = 1312 / (1312 + 437), tpCtoD = 437 / (437 + 1312), tpDtoD = 1,
  cost_health_A = "cost_direct_med_A + cost_comm_care_A",

list_paramwise_psa_result(result, NULL, NULL, NULL)
```

---

load_trial_data *Function to load the file containing trial data and return it*

Description

Function to load the file containing trial data and return it

Usage

```
load_trial_data(file = NULL, sheet = NULL)
```

Arguments

file	name of the file in full
sheet	name of the sheet if excel work book is given

Value

trial data if success, else -1

Examples

```
load_trial_data(system.file("extdata", "trial_data.csv",
  package = "packDAMipd"
))
```

---

map_eq5d5Lto3L_VanHout

Function to map EQ5D5L scores to EQ5D3L scores and then add to IPD data

---

Description

Function to map EQ5D5L scores to EQ5D3L scores and then add to IPD data

Usage

```
map_eq5d5Lto3L_VanHout(ind_part_data, eq5d_nrcode)
```

Arguments

ind_part_data	a data frame
eq5d_nrcode	non response code for EQ5D5L, default is NA

Value

qaly included modified data, if success -1, if failure

Source

http://eprints.whiterose.ac.uk/121473/1/Devlin_et_al-2017-Health_Economics.pdf

Examples

```
library(valueEQ5D)
datafile <- system.file("extdata", "trial_data.csv",
package = "packDAMipd")
trial_data <- load_trial_data(datafile)
map_eq5d5Lto3L_VanHout(trial_data, NA)
```

map_resource_use_categories

Function to to read the text form of resource use and replace it with standard texts of resoure use ie. some one can describe GP visit as GP surgery visit, surgery visit or general practioners visit etc. Here all these texts should be given in a excel or csv file and then corresponidng standard form will be read from the file and will be replaced.

Description

Function to to read the text form of resource use and replace it with standard texts of resoure use ie. some one can describe GP visit as GP surgery visit, surgery visit or general practioners visit etc. Here all these texts should be given in a excel or csv file and then corresponidng standard form will be read from the file and will be replaced.

Usage

```
map_resource_use_categories(
  the_data,
  service_actual,
  new_column,
  mapped_data,
  mapped_use,
  analysis,
  replace_only,
  relevant_column = NULL,
  check_value_relevant = NULL,
  nhs_use_column = NULL,
  check_value_nhs_use = NULL
)
```

Arguments

the_data	the data where the observations are held
service_actual	columna name of the actual service use
new_column	the name of the column where the mapped resource use to be
mapped_data	data where the service name and mapped service name has been stored
mapped_use	columan name of mapped resource use in mapped_data
analysis	base case or secondary
replace_only	if we want to replace only certain resource use
relevant_column	the name of the column where the mapped resource use is indicated as relevant or not
check_value_relevant	how is the mapped resource is indicated as relevant by a value

nhs_use_column the name of the column where the mapped resource use comes under NHS or not

check_value_nhs_use
value that is used to indicated the nhs use

Value

the data with added sum

`markov_model` *Definition of Markov model and trace*

Description

Definition of Markov model and trace

Usage

```
markov_model(
  current_strategy,
  cycles,
  initial_state,
  discount = c(0, 0),
  parameter_values = NULL,
  half_cycle_correction = TRUE,
  state_cost_only_prevalent = FALSE,
  state_util_only_prevalent = FALSE,
  method = "half cycle correction",
  startup_cost = NULL,
  startup_util = NULL
)
```

Arguments

current_strategy
strategy object

cycles no of cycles

initial_state value of states initially

discount rate of discount for costs and qalys

parameter_values
parameters for assigning health states and probabilities

half_cycle_correction
boolean to indicate half cycle correction

state_cost_only_prevalent
: boolean parameter to indicate if the costs for state occupancy is only for those in the state excluding those that transitioned new. This is relevant when the transition cost is provided for eg. in a state with dialysis the cost of previous dialysis is different from the newly dialysis cases. Then the state_cost_only_prevalent should be TRUE

state_util_only_prevalent
: boolean parameter to indicate if the utilities for state occupancy is only for those in the state excluding those that transitioned new.

method
: what type of half cycle correction needed

startup_cost
: cost of states initially

startup_util
: utility of states initially if any

Details

Use the strategy, cycles, initial state values creating the markov model and trace. As many probabilities /cost/utility value depend on age/time the evaluation and assignment happens during each cycle. At the heart it does a matrix multiplication using the previous row of the trace matrix and the columns of the transition matrix. Also checks for population loss, calculates cumulative costs and qalys (accounts for discounting and half cycle correction)

Value

Markov trace

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
tm <- populate_transition_matrix(2, tmat, c(0.5, 0.5, 0, 1))
a <- health_state("Healthy", 1, 1, 0, FALSE)
b <- health_state("Dead", 1, 0, 0, TRUE)
health_states <- combine_state(a, b)
this.strategy <- strategy(tm, health_states, "intervention")
markov_model(this.strategy, 10, c(1, 0))
```

---

markov_model_sojourntime

Definition of Markov model and trace

Description

Definition of Markov model and trace

Usage

```
markov_model_sojourntime(
  current_strategy,
  nCycles,
  initial_state,
  discount = c(0, 0),
  parameter_values = NULL,
  half_cycle_correction = TRUE,
  state_cost_only_prevalent = FALSE,
  state_util_only_prevalent = FALSE,
  method = "half cycle correction",
  startup_cost = NULL,
  startup_util = NULL
)
```

Arguments

current_strategy	strategy object
nCycles	no of cycles
initial_state	value of states initially
discount	rate of discount for costs and qalys
parameter_values	parameters for assigning health states and probabilities
half_cycle_correction	boolean to indicate half cycle correction
state_cost_only_prevalent	boolean parameter to indicate if the costs for state occupancy is only for those in the state excluding those that transitioned new. This is relevant when the transition cost is provided for eg. in a state with dialysis the cost of previous dialysis is different from the newly dialysis cases. Then the state_cost_only_prevalent should be TRUE
state_util_only_prevalent	boolean parameter to indicate if the utilities for state occupancy is only for those in the state excluding those that transitioned new.
method	what type of half cycle correction needed
startup_cost	cost of states initially
startup_util	utility of states initially if any

Details

Use the strategy, cycles, initial state values creating the markov model and trace. As many probabilities /cost/utility value depend on age/time the evaluation and assignment happens during each cycle. At the heart it does a matrix multiplication using the previous row of the trace matrix and the columns of the transition matrix. Also checks for population loss, calculates cumulative costs and qalys (accounts for discounting and half cycle correction)

Value

Markov trace

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
tm <- populate_transition_matrix(2, tmat, c(0.5, 0.5, 0, 1))
a <- health_state("Healthy", 1, 1, 0, FALSE)
b <- health_state("Dead", 1, 0, 0, TRUE)
health_states <- combine_state(a, b)
this.strategy <- strategy(tm, health_states, "intervention")
markov_model(this.strategy, 10, c(1, 0))
```

---

microcosting_liquids_long

Function to estimate the cost of liquids when IPD is in long format

---

Description

Function to estimate the cost of liquids when IPD is in long format

Usage

```
microcosting_liquids_long(
  the_columns,
  ind_part_data_long,
  name_med,
  brand_med = NULL,
  dose_med,
  unit_med = NULL,
  bottle_size,
  bottle_size_unit = NULL,
  bottle_lasts,
  bottle_lasts_unit = NULL,
  preparation_dose = NULL,
  preparation_unit = NULL,
  timeperiod,
  unit_cost_data,
  unit_cost_column,
  cost_calculated_per,
  strength_column,
  list_of_code_names = NULL,
  list_of_code_brand = NULL,
  list_of_code_dose_unit = NULL,
  list_of_code_bottle_size_unit = NULL,
  list_of_code_bottle_lasts_unit = NULL,
```

```
  list_preparation_dose_unit = NULL,
  eqdose_covtab = NULL,
  basis_strength_unit = NULL
)
```

Arguments

the_columns	columns that are to be used to convert the data from long to wide
ind_part_data_long	IPD
name_med	name of medication
brand_med	brand name of medication if revealed
dose_med	dose of medication used
unit_med	unit of medication ; use null if its along with the dose
bottle_size	size of the bottle used
bottle_size_unit	unit of bottle volume
bottle_lasts	how long the bottle lasted
bottle_lasts_unit	time unit of how long the bottle lasted
preparation_dose	dose if preparation is given
preparation_unit	unit of preparatio dose
timeperiod	time period for cost calculation
unit_cost_data	unit costs data
unit_cost_column	column name of unit cost in unit_cost_data
cost_calculated_per	column name of unit where the cost is calculated
strength_column	column column name that has strength of medication
list_of_code_names	if names is coded, give the code:name pairs, optional
list_of_code_brand	if brand names are coded, give the code:brand pairs, optional
list_of_code_dose_unit	if unit is coded, give the code:unit pairs, optional
list_of_code_bottle_size_unit	list of bottle size units and codes
list_of_code_bottle_lasts_unit	list of time of bottle lasts and codes
list_preparation_dose_unit	list of preparation dose units and codes
eqdose_covtab	table to get the conversion factor for equivalent doses, optional
basis_strength_unit	strength unit to be taken as basis required for total medication calculations

Value

the calculated cost of tablets along with original data

Examples

```
med_costs_file <- system.file("extdata", "medicaton_costs_all.xlsx",
package = "packDAMipd")
data_file <- system.file("extdata", "medication_liq.xlsx",
package = "packDAMipd")
ind_part_data <- load_trial_data(data_file)

basis_strength_unit = NULL)
```

---

microcosting_liquids_wide

Function to estimate the cost of liquids taken (from IPD)

Description

Function to estimate the cost of liquids taken (from IPD)

Usage

```
microcosting_liquids_wide(
  ind_part_data,
  name_med,
  brand_med = NULL,
  dose_med,
  unit_med = NULL,
  bottle_size,
```

```
  bottle_size_unit = NULL,
  bottle_lasts,
  bottle_lasts_unit = NULL,
  preparation_dose = NULL,
  preparation_unit = NULL,
  timeperiod,
  unit_cost_data,
  unit_cost_column,
  cost_calculated_per,
  strength_column,
  list_of_code_names = NULL,
  list_of_code_brand = NULL,
  list_of_code_dose_unit = NULL,
  list_of_code_bottle_size_unit = NULL,
  list_of_code_bottle_lasts_unit = NULL,
  list_preparation_dose_unit = NULL,
  eqdose_covtab = NULL,
  basis_strength_unit = NULL
)
```

Arguments

ind_part_data	IPD
name_med	name of medication
brand_med	brand name of medication if revealed
dose_med	dose of medication used
unit_med	unit of medication ; use null if its along with the dose
bottle_size	size of the bottle used
bottle_size_unit	unit of bottle volume
bottle_lasts	how long the bottle lasted
bottle_lasts_unit	time unit of how long the bottle lasted
preparation_dose	dose if preparation is given
preparation_unit	unit of preparatio dose
timeperiod	time period for cost calculation
unit_cost_data	unit costs data
unit_cost_column	column name of unit cost in unit_cost_data
cost_calculated_per	column name of unit where the cost is calculated
strength_column	column column name that has strength of medication

`list_of_code_names`
: if names is coded, give the code:name pairs, optional

`list_of_code_brand`
: if brand names are coded, give the code:brand pairs, optional

`list_of_code_dose_unit`
: if unit is coded, give the code:unit pairs, optional

`list_of_code_bottle_size_unit`
: list of bottle size units and codes

`list_of_code_bottle_lasts_unit`
: list of time of bottle lasts and codes

`list_preparation_dose_unit`
: list of preparation dose units and codes

`eqdose_covtab`
: table to get the conversion factor for equivalent doses, optional, but the column names have to unique Similar to c("Drug", "form", "unit", "factor") or c("Drug", "form", "unit", "conversion")

`basis_strength_unit`
: strength unit to be taken as basis required for total medication calculations

Value

the calculated cost of tablets along with original data

Examples

```
med_costs_file <- system.file("extdata", "medicaton_costs_all.xlsx",
package = "packDAMipd")

  list_of_code_dose_unit = NULL,
  list_of_code_brand = NULL,
  eqdose_cov_tab = NULL,
  basis_strength_unit = NULL
)
```

Arguments

`the_columns`	columns that are to be used to convert the data from long to wide
`ind_part_data_long`	IPD
`name_med`	name of medication
`brand_med`	brand name of medication if revealed
`dose_med`	dose of medication used
`unit_med`	unit of medication ; use null if its along with the dose
`no_taken`	how many taken

freq_taken frequency of medication

timeperiod time period for cost calculation

unit_cost_data unit costs data

unit_cost_column
column name of unit cost in unit_cost_data

cost_calculated_per
column name of unit where the cost is calculated

strength_column
column column name that contain strength of medication

list_of_code_names
if names is coded, give the code:name pairs, optional

list_of_code_freq
if frequency is coded, give the code:frequency pairs, optional

list_of_code_dose_unit
if unit is coded, give the code:unit pairs, optional

list_of_code_brand
if brand names are coded, give the code:brand pairs, optional

eqdose_cov_tab table to get the conversion factor for equivalent doses, optional

basis_strength_unit
strength unit to be taken as basis required for total medication calculations

Value

the calculated cost of tablets along with original data

Examples

```
med_costs_file <- system.file("extdata", "medicaton_costs_all.xlsx",
package = "packDAMipd")
data_file <- system.file("extdata", "medication_all.xlsx",
package = "packDAMipd")
ind_part_data <- load_trial_data(data_file)
med_costs <- load_trial_data(med_costs_file)
conv_file <- system.file("extdata", "Med_calc.xlsx", package = "packDAMipd")
table <- load_trial_data(conv_file)
names <- colnames(ind_part_data)
ending <- length(names)
ind_part_data_long <- tidyr::gather(ind_part_data, measurement, value,
names[2]:names[ending], factor_key = TRUE)
the_columns <- c("measurement", "value")
res <- microcosting_tablets_long(the_columns,
ind_part_data_long = ind_part_data_long, name_med = "tab_name",
brand_med = "tab_brand", dose_med = "tab_strength",
unit_med = "tab_str_unit",
no_taken = "tab_no_taken", freq_taken = "tab_frequency",
timeperiod = "2 months",unit_cost_data = med_costs,
unit_cost_column = "UnitCost", cost_calculated_per  = "Basis",
strength_column = "Strength", list_of_code_names = NULL,
list_of_code_freq = NULL,list_of_code_dose_unit = NULL,
eqdose_cov_tab = table, basis_strength_unit = "mg")
```

`microcosting_tablets_wide` *Function to estimate the cost of tablets taken (from IPD)*

Description

Function to estimate the cost of tablets taken (from IPD)

Usage

```
microcosting_tablets_wide(
  ind_part_data,
  name_med,
  brand_med = NULL,
  dose_med,
  unit_med = NULL,
  no_taken,
  freq_taken,
  timeperiod,
  unit_cost_data,
  unit_cost_column,
  cost_calculated_per,
  strength_column,
  list_of_code_names = NULL,
  list_of_code_freq = NULL,
  list_of_code_dose_unit = NULL,
  list_of_code_brand = NULL,
  eqdose_cov_tab = NULL,
  basis_strength_unit = NULL
)
```

Arguments

`ind_part_data`	IPD
`name_med`	name of medication
`brand_med`	brand name of medication if revealed
`dose_med`	dose of medication used
`unit_med`	unit of medication ; use null if its along with the dose
`no_taken`	how many taken
`freq_taken`	frequency of medication
`timeperiod`	time period for cost calculation
`unit_cost_data`	unit costs data
`unit_cost_column`	column name of unit cost in unit_cost_data

`cost_calculated_per`
: column name of unit where the cost is calculated

`strength_column`
: column column name that contain strength of medication

`list_of_code_names`
: if names is coded, give the code:name pairs, optional

`list_of_code_freq`
: if frequency is coded, give the code:frequency pairs, optional

`list_of_code_dose_unit`
: if unit is coded, give the code:unit pairs, optional

`list_of_code_brand`
: if brand names are coded, give the code:brand pairs, optional

`eqdose_cov_tab`
: table to get the conversion factor for equivalent doses, optional, but the column names have to unique Similar to c("Drug", "form", "unit", "factor") or c("Drug", "form", "unit", "conversion")

`basis_strength_unit`
: strength unit to be taken as basis required for total medication calculations

Details

Assumes individual level data has name of medication, dose, dose unit, number taken, frequency taken, and basis time Assumes unit cost data contains the name of medication, form/type, strength, unit of strength (or the unit in which the cost calculated), preparation, unit cost, size and size unit (in which name, forms, size, size unit, and preparation are not passed on) @importFrom dplyr %>%

Value

the calculated cost of tablets along with original data

Examples

```
med_costs_file <- system.file("extdata", "medicaton_costs_all.xlsx",
package = "packDAMipd")
data_file <- system.file("extdata", "medication_all.xlsx",
package = "packDAMipd")

```

plot_ceac_psa *Function to plot CEAC*

Description

Function to plot CEAC

Usage

```
plot_ceac_psa(
  control_markov,
  trt_markov,
  psa_table_ctrl,
  psa_table_trt,
  thresholds,
  num_rep,
  comparator
)
```

Arguments

control_markov	markov model for control
trt_markov	markov model for treatment
psa_table_ctrl	param table for psa for control
psa_table_trt	param table for psa for treatment
thresholds	threshold values of WTP
num_rep	number of repetitions
comparator	the strategy to be compared with

Value

plot of ceac

plot_dsa *Function to plot results of sensitivity analysis do_sensitivity_analysis()*

Description

Function to plot results of sensitivity analysis do_sensitivity_analysis()

Usage

```
plot_dsa(
  result_dsa_control,
  plotfor,
  type = "range",
  result_dsa_treat = NULL,
  threshold = NULL,
  comparator = NULL
)
```

Arguments

result_dsa_control	result from deterministic sensitivity analysis for first or control model
plotfor	the variable to plotfor e.g. cost, utility NMB etc
type	type of analysis, range or difference
result_dsa_treat	result from deterministic sensitivity analysis for the comparative Markov model
threshold	threshold value of WTP
comparator	the strategy to be compared with

Value

plot of sensitivity analysis

Examples

```

---

plot_dsa_difference *Function to do some checks before plotting sensitivity analysis results*

Description

Function to do some checks before plotting sensitivity analysis results

Usage

```
plot_dsa_difference(ob_results, plotfor, plot_var)
```

Arguments

ob_results	results from deterministic sensitivity analysis
plotfor	the quantity plotting
plot_var	the variable

Value

plot

---

plot_dsa_icer_range *Function to do some checks before plotting sensitivity analysis results*

Description

Function to do some checks before plotting sensitivity analysis results

Usage

```
plot_dsa_icer_range(ob_results, plot_var)
```

Arguments

ob_results	results from deterministic sensitivity analysis
plot_var	the variable

Value

plot

plot_dsa_nmb_range *Function to do some checks before plotting sensitivity analysis results*

Description

Function to do some checks before plotting sensitivity analysis results

Usage

```
plot_dsa_nmb_range(ob_results, plot_var)
```

Arguments

ob_results	results from deterministic sensitivity analysis
plot_var	the variable

Value

plot

plot_dsa_others_range *Function to do some checks before plotting sensitivity analysis results*

Description

Function to do some checks before plotting sensitivity analysis results

Usage

```
plot_dsa_others_range(ob_results, plot_var)
```

Arguments

ob_results	results from deterministic sensitivity analysis
plot_var	the variable

Value

plot

`plot_efficiency_frontier` *Plot efficiency frontier*

Description

Plot efficiency frontier

Usage

```
plot_efficiency_frontier(results_calculate_icer_nmb, threshold)
```

Arguments

`results_calculate_icer_nmb`	results from cea (from calculate_icer_nmb method)
`threshold`	threshold value

Value

plot well <- health_state("well", cost = 0, utility = 1) disabled <- health_state("disabled", cost = 100, utility = 1) dead <- health_state("dead", cost = 0, utility = 0) tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6)) colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead") tm <- populate_transition_matrix(3, tmat, c(0.6, 0.2, 0.2, 0.6, 0.4, 1), colnames(tmat)) health_states <- combine_state(well, disabled, dead) this.strategy <- strategy(tm, health_states, "control") this_markov <- markov_model(this.strategy, 24, c(1000, 0, 0), c(0,0)) well <- health_state("well", cost = 0, utility = 1) disabled <- health_state("disabled", cost = 10, utility = 0.5) dead <- health_state("dead", cost = 0, utility = 0) tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6)) colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead") tm <- populate_transition_matrix(3, tmat, c(0.4, 0.4, 0.2, 0.6, 0.4, 1), colnames(tmat)) health_states <- combine_state(well, disabled, dead) this.strategy <- strategy(tm, health_states, "intervention") sec_markov <- markov_model(this.strategy, 24, c(1000, 0, 0), c(0,0)) list_markov <- combine_markov(this_markov, sec_markov) results_cea <- calculate_icer_nmb(list_markov, 20000, comparator = "control") plot_efficiency_frontier(results_cea, c(1000, 2000))

`plot_histogram_onetimepoint_twogroups` *Function to plot mean and SE for longitudinal observations for twogroups compared*

Description

Function to plot mean and SE for longitudinal observations for twogroups compared

Usage

```
plot_histogram_onetimepoint_twogroups(
  thedata,
  colname,
  timepointstring,
  xstring,
  ylimits = NULL,
  nbins = NULL
)
```

Arguments

thedata	the data where the observations are held
colname	columnname in the data where the intersted observations
timepointstring	the text that correspond to timepoints at which the descriptive analysis is done
xstring	xlable text
ylimits	on hsitogram plot
nbins	nbins the number of bins to plot histogram

Value

the historgram plot at a timepoint for two groups

Examples

```
eg_data <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 7, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2")))
plot_histogram_onetimepoint_twogroups(eg_data,  c("mark_at_2"), c("1","2"),
 "mark")
```

---

plot_meanSE_longitudinal_twogroups

Function to plot mean and SE for longitudinal observations for twogroups compared

---

Description

Function to plot mean and SE for longitudinal observations for twogroups compared

Usage

```
plot_meanSE_longitudinal_twogroups(
  thedata,
  columnnames,
  timepoints,
  observation
)
```

Arguments

thedata	the data where the observations are held
columnnames	columnnames in the data where the intersted observations
timepoints	the timepoints at which the descriptive analysis is done
observation	name of the observations

Value

the plot that shows mean and SE

Examples

```
eg_data <- as.data.frame(list(no = c(1, 2, 3, 4),
mark_at_1 = c(12, 7, 23, 45), gender = c("M", "F", "M", "F"),
mark_at_2 = c(12, 34, 89, 45), trialarm = c("1","1","2","2")))
plot_meanSE_longitudinal_twogroups(eg_data,  c("mark_at_1", "mark_at_2"),
c("1","2"), "mark")
```

---

plot_model *E1. Plot a Markov model*

Description

E1. Plot a Markov model

Usage

```
plot_model(markov)
```

Arguments

markov	markov_model object

Value

plots

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
tm <- populate_transition_matrix(2, tmat, c(0.5, 0.5, 0, 1))
a <- health_state("Healthy", 1, 1, 0, FALSE)
b <- health_state("Dead", 1, 0, 0, TRUE)
health_states <- combine_state(a, b)
this.strategy <- strategy(tm, health_states, "intervention")
this_markov <- markov_model(this.strategy, 10, c(1, 0), c(0, 0))
p <- plot_model(this_markov)
```

---

plot_nmb_lambda *Plot cost effectiveness acceptability curve*

Description

Plot cost effectiveness acceptability curve

Usage

```
plot_nmb_lambda(list_markov, threshold_values, comparator, currency = "GBP")
```

Arguments

list_markov	markov_model objects
threshold_values	list of threshold values
comparator	the comparator
currency	currency

Value

plots

Examples

```
well <- health_state("well", cost = 0, utility = 1)
disabled <- health_state("disabled", cost = 100, utility = 1)
dead <- health_state("dead", cost = 0, utility = 0)

colnames(tmat) <- rownames(tmat) <- c("well", "disabled", "dead")
tm <- populate_transition_matrix(3, tmat, c(0.4, 0.4, 0.2, 0.6, 0.4, 1),
colnames(tmat))
health_states <- combine_state(well, disabled, dead)
this.strategy <- strategy(tm, health_states, "intervention")
sec_markov <- markov_model(this.strategy, 24, c(1000, 0, 0), c(0, 0))
list_markov <- combine_markov(this_markov, sec_markov)
plot_nmb_lambda(list_markov, c(1000, 2000, 3000), comparator = "control")
```

`plot_prediction_parametric_survival` *Plot the predicted survival curves for covariates keeping the others fixed*

Description

Plot the predicted survival curves for covariates keeping the others fixed

Usage

```
plot_prediction_parametric_survival(
  param_to_be_estimated,
  indep_var,
  covariates,
  dataset,
  fit,
  timevar_survival
)
```

Arguments

`param_to_be_estimated`	parameter to be estimated
`indep_var`	variable for which the levels have to be identified
`covariates`	the covariates
`dataset`	the dataset where these variables contain
`fit`	the fit result survreg
`timevar_survival`	time variable from the dataset

Value

plot

Examples

```
data_for_survival <- survival::lung
surv_estimated <- use_parametric_survival("status", data_for_survival,
"sex",
info_distribution = "weibull",covariates = c("ph.ecog"),"time")
plot_prediction_parametric_survival("status", "sex",
covariates = c("ph.ecog"),data_for_survival, surv_estimated$fit, "time")
```

`plot_return_residual_cox` *Plotting and return the residuals after cox proportional hazard model*

Description

Plotting and return the residuals after cox proportional hazard model

Usage

```
plot_return_residual_cox(
  param_to_be_estimated,
  indep_var,
  covariates,
  fit,
  dataset
)
```

Arguments

`param_to_be_estimated`	parameter to be estimated
`indep_var`	independent variable
`covariates`	covariates
`fit`	fit object from coxph method
`dataset`	data used for cox ph model

Value

plot and the residuals

Examples

```
data_for_survival <- survival::lung
surv_estimated <- use_coxph_survival("status", data_for_survival, "sex",
covariates = c("ph.ecog"), "time")
plot_return_residual_cox("status", "sex", covariates = c("ph.ecog"),
surv_estimated$fit,data_for_survival )
```

`plot_return_residual_survival` *Plotting and return the residuals after survival model*

Description

Plotting and return the residuals after survival model

Usage

```
plot_return_residual_survival(
  param_to_be_estimated,
  indep_var,
  covariates,
  fit
)
```

Arguments

`param_to_be_estimated`	parameter to be estimated
`indep_var`	independent variable
`covariates`	covariates
`fit`	fit object from survreg method

Value

plot and the residuals

Examples

```
data_for_survival <- survival::lung
surv_estimated <- use_parametric_survival("status", data_for_survival,
"sex",
info_distribution = "weibull",covariates = c("ph.ecog"), "time")
plot_return_residual_survival("status", "sex",
covariates = c("ph.ecog"),surv_estimated$fit)
```

plot_return_survival_curve *Plotting survival function for all covariates using survfit*

Description

Plotting survival function for all covariates using survfit

Usage

```
plot_return_survival_curve(
  param_to_be_estimated,
  dataset,
  indep_var,
  covariates,
  timevar_survival
)
```

Arguments

param_to_be_estimated	parameter to be estimated
dataset	param describing the methods
indep_var	independent variable
covariates	covariates
timevar_survival	time variable for survival analysis

Value

plot and the survival function values

Examples

```
data_for_survival <- survival::lung
plot_return_survival_curve(param_to_be_estimated = "status",
dataset = data_for_survival,indep_var = "sex",covariates = c("ph.ecog"),
timevar_survival = "time")
```

`plot_survival_cox_covariates` *Plotting survival function for all covariates calculated from cox regression results and returned coefficients*

Description

Plotting survival function for all covariates calculated from cox regression results and returned coefficients

Usage

```
plot_survival_cox_covariates(
  coxfit,
  dataset,
  param_to_be_estimated,
  covariates,
  indep_var
)
```

Arguments

`coxfit`	cox regression fit result
`dataset`	param describing the methods
`param_to_be_estimated`	parameter to be estimated
`covariates`	covariates
`indep_var`	independent variable

Value

plot and the survival function values

Examples

```
data_for_survival <- survival::lung
surv_estimated <- use_coxph_survival("status", data_for_survival, "sex",
covariates = c("ph.ecog"), "time")
plot_survival_cox_covariates(surv_estimated$fit,data_for_survival,
"status", covariates = c("ph.ecog"), "sex")
```

populate_transition_matrix *Populate transition matrix*

Description

Populate transition matrix

Usage

```
populate_transition_matrix(no_states, tmat, list_prob, name_states = NULL)
```

Arguments

no_states	number of the health states
tmat	A transition matrix in the format from the package 'mstate'
list_prob	list of probabilities as in the order of transitions (row wise)
name_states	names of the health states

Details

If the state names are null, they are replaced with numbers starting from 1 First find those missing probabilities, and fill a list from the given list of probabilities and fill those are not NA in the matrix Note that the probabilities need not be numeric here and no checks are needed for sum

Value

value of the transition matrix

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
populate_transition_matrix(2, tmat, list_prob = c(0.2, 0.5, 0, 0.3))
```

predict_coxph *Predict risk/hazard function for cox ph regression*

Description

Predict risk/hazard function for cox ph regression

Usage

```
predict_coxph(
  coxfit,
  dataset,
  param_to_be_estimated,
  covariates,
  indep_var,
  timevar_survival
)
```

Arguments

coxfit	cox regression fit result
dataset	param describing the methods
param_to_be_estimated	parameter to be estimated
covariates	covariates
indep_var	independent variable
timevar_survival	time variable

Details

"risk" option for "type" returns the hazard ratio relative to mean e.g given below For lung data with data_for_survival <- survival::lung fit <- use_coxph_survival("status", data_for_survival, "sex", covariates = c("ph.ecog"), "time") coeffit = fit$coefficients r1234 <- exp(coeffit("sex")lung$sex+ coeffit("ph.ecog")lung$ph.ecog) rMean <- exp(sum(coef(fit) * fit$means, na.rm=TRUE)) rr <- r1234/rMean

Value

plot and the survival function values

Examples

```
data_for_survival <- survival::lung
surv_estimated <- use_coxph_survival("status", data_for_survival,
"sex",covariates = c("ph.ecog"), "time")
predict_coxph(surv_estimated$fit,data_for_survival, "status","sex",
covariates = c("ph.ecog"), "time")
```

promis3a_scoring.df *promis 3a scoring table*

Description

promis 3a scoring table

Usage

```
promis3a_scoring.df
```

Format

A 14 by 3 dataframe

Source

created on April 08, 2021

report_sensitivity_analysis *Function to report deterministic sensitivity analysis*

Description

Function to report deterministic sensitivity analysis

Usage

```
report_sensitivity_analysis(
  result_dsa_control,
  result_dsa_treat = NULL,
  threshold = NULL,
  comparator = NULL
)
```

Arguments

result_dsa_control	result from deterministic sensitivity analysis for first or control model
result_dsa_treat	result from deterministic sensitivity analysis for the comparative Markov model
threshold	threshold value of WTP
comparator	the strategy to be compared with

Value

report in the form of a table

Examples

```
param_list <- define_parameters(
cost_zido = 2278, cost_direct_med_A = 1701,
cost_comm_care_A = 1055, cost_direct_med_B = 1774,
cost_comm_care_B = 1278,
cost_direct_med_C = 6948, cost_comm_care_C = 2059,
tpAtoA = 1251 / (1251 + 483),
tpAtoB = 350 / (350 + 1384), tpAtoC = 116 / (116 + 1618),
tpAtoD = 17 / (17 + 1717),
tpBtoB = 731 / (731 + 527), tpBtoC = 512 / (512 + 746),
tpBtoD = 15 / (15 + 1243),
tpCtoC = 1312 / (1312 + 437), tpCtoD = 437 / (437 + 1312),
tpDtoD = 1,
cost_health_A = "cost_direct_med_A +  cost_comm_care_A",

upp_values)
result <- do_sensitivity_analysis(mono_markov, param_table)
 reporting <- report_sensitivity_analysis(result)
```

`return0_if_not_null_na`

Function to return 0 if the param is not null or NA trimming the white spaces

---

Description

Function to return 0 if the param is not null or NA trimming the white spaces

Usage

```
return0_if_not_null_na(param)
```

Arguments

param	the form of medication either tablet or patch

Value

zero or -1

Examples

```
parame = NULL
ans <- return0_if_not_null_na(parame)
parame = 1
ans <- return0_if_not_null_na(parame)
```

---

return_equal_liststring_col

Function to get the subset of data compared to a string after trimming the white spaces

---

Description

Function to get the subset of data compared to a string after trimming the white spaces

Usage

```
return_equal_liststring_col(col, the_data, list_str)
```

Arguments

col	the form of medication either tablet or patch
the_data	the data to be get the subset from
list_str	list of strings to be compared

Value

the subset data

Examples

```
the_data <- as.data.frame(cbind(c("one", "two"), c("a", "b")))
colnames(the_data) <- c("name", "brand")
ans <- return_equal_liststring_col(2, the_data, c("a", "cc"))
```

`return_equal_liststring_listcol` *Function to get the subset of data compared to a string after trimming the white spaces*

Description

Function to get the subset of data compared to a string after trimming the white spaces

Usage

```
return_equal_liststring_listcol(col, the_data, list_str)
```

Arguments

`col`	the form of medication either tablet or patch
`the_data`	the data to be get the subset from
`list_str`	list of strings to be compared

Value

the subset data

Examples

```
the_data <- as.data.frame(cbind(c("one", "two"), c("tablet", "tablets"),
c("aa", "bb")))
colnames(the_data) <- c("name", "brand_a", "xx")
ans <- return_equal_liststring_listcol(2, the_data, c("tablet", "tablets"))
```

return_equal_str_col *Function to get the subset of data compared to a string after trimming the white spaces*

Description

Function to get the subset of data compared to a string after trimming the white spaces

Usage

```
return_equal_str_col(col, the_data, the_str)
```

Arguments

col	the form of medication either tablet or patch
the_data	the data to be get the subset from
the_str	the string to be compared

Value

the subset data

Examples

```
the_data <- as.data.frame(cbind(c("one", "two"), c("a", "b")))
colnames(the_data) <- c("name", "brand")
ans <- return_equal_str_col(2, the_data, "a")
```

set_var_state *Set the attribute for the health state*

Description

Set the attribute for the health state

Usage

```
set_var_state(state, var, new_value)
```

Arguments

state	object of class health state
var	attribute of the health state
new_value	new value to be assigned

Details

After checking the given state is a health state the value of the variable is set if the value is not numeric, it is being parsed to form an expression

Value

modified health state

Examples

```
set_var_state(health_state("IT", 100, 0.4, 0, FALSE), "cost", 1)
```

---

strategy *Definition of strategy - or arm*

Description

Definition of strategy - or arm

Usage

```
strategy(trans_mat, states, name, trans_cost = NULL, trans_util = NULL)
```

Arguments

trans_mat	transition matrix
states	health states
name	name of the strategy
trans_cost	values of costs if these are attached to transitions
trans_util	values of utility if these are attached to transitions

Details

Defining strategy keeping all transition matrix, states and names together to use in defining Markov model

Value

object strategy

Examples

```
tmat <- rbind(c(1, 2), c(3, 4))
colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead")
tm <- populate_transition_matrix(2, tmat, c(0.5, 0.5, 0, 1))
a <- health_state("Healthy", 1, 1, 0, FALSE)
b <- health_state("Dead", 1, 0.5, 0, FALSE)
states <- combine_state(a, b)
strategy(tm, states, "intervention")
```

summary_plot_psa *Function to summarise and plot probabilistic sensitivity analysis*

Description

Function to summarise and plot probabilistic sensitivity analysis

Usage

```
summary_plot_psa(
  result_psa_params_control,
  result_psa_params_treat = NULL,
  threshold = NULL,
  comparator = NULL
)
```

Arguments

result_psa_params_control	result from probabilistic sensitivity analysis for first or control model
result_psa_params_treat	result from probabilistic sensitivity analysis for the comparative Markov model
threshold	threshold value of WTP
comparator	the strategy to be compared with

Value

plot of sensitivity analysis

Examples

```
param_list <- define_parameters(
cost_direct_med_A = 1701,
cost_direct_med_B = 1774, tpAtoA = 0.2,
 tpAtoB = 0.5, tpAtoC = 0.3,
 tpBtoB = 0.3, tpBtoC = 0.7,
 tpCtoC = 1,cost_health_A = "cost_direct_med_A",
 cost_health_B = "cost_direct_med_B")
 sample_list <- define_parameters(cost_direct_med_A = "gamma(mean = 1701,
 sd = sqrt(1701))")
 A <- health_state("A", cost = "cost_health_A ", utility = 1)
 B <- health_state("B", cost = "cost_health_B", utility = 1)
 C <- health_state("C", cost = 0, utility = 0, absorb = "TRUE")
 tmat <- rbind(c(1, 2, 3), c(NA, 4, 5), c(NA, NA, 6))
 colnames(tmat) <- rownames(tmat) <- c("A", "B", "C")
 tm <- populate_transition_matrix(3, tmat, c(
 "tpAtoA", "tpAtoB", "tpAtoC",  "tpBtoB", "tpBtoC", "tpCtoC"),
 colnames(tmat))
```

```
health_states <- combine_state(A, B, C)
mono_strategy <- strategy(tm, health_states, "mono")

discount = c(0.06, 0), param_list)
param_table_comb <- define_parameters_psa(param_list_comb, sample_list)
result_comb <- do_psa(comb_markov, param_table_comb, 3)
summary_plot_psa(result, result_comb, 2000, "mono")
```

---

table_param.df *Parameter table created*

Description

Parameter table created

Usage

```
table_param.df
```

Format

A 11 by 2 dataframe

Source

created on Jan 15, 2020

---

trace_data.df *Trace matrix*

Description

Trace matrix

Usage

```
trace_data.df
```

Format

A 11 by 2 dataframe

Source

created on Nov 26, 2019 from tmat <- rbind(c(1, 2), c(3, 4)) colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead") tm <- transition_matrix(2, tmat, c(0.5, 0.5, 0, 1)) a <- health_state("Healthy", 1, 1, FALSE) b <- health_state("Dead", 1, 0, TRUE) health_states <- combine_state(a, b) this.strategy <- strategy(tm, health_states, "intervention")

---

transition_cost_util *Create the the values of cost and utility while transition*

Description

Create the the values of cost and utility while transition

Usage

```
transition_cost_util(
  no_states,
  tmat_cost_util,
  list_values,
  name_states = NULL
)
```

Arguments

no_states	number of the health states
tmat_cost_util	A transition matrix for the cost/utility values in the format from the package 'mstate' use NA to indicate if the value is zero
list_values	list of probabilities as in the order of transitions (row wise)
name_states	names of the health states

Details

Similar to transition matrix but for denoting one time change during transitions

Value

value of the transition matrix

Examples

```
tmat_cost <- rbind(c(NA, 1), c(NA, NA))
colnames(tmat_cost) <- rownames(tmat_cost) <- c("Healthy", "Dead")
transition_cost_util(2, tmat_cost, list_values = c(500))
```

`trial_data.df` *Example trial data*

Description

Example trial data

Usage

```
trial_data.df
```

Format

A 31 by 33 dataframe

Source

created on Jan 15, 2020

`use_coxph_survival` ## *Get the parameter values using the survival analysis using cox proportional hazard*

Description

Get the parameter values using the survival analysis using cox proportional hazard

Usage

```
use_coxph_survival(
  param_to_be_estimated,
  dataset,
  indep_var,
  covariates,
  timevar_survival
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
covariates	list of covariates - calculations to be done before passing
timevar_survival	time variable for survival analysis, default is NA false by default

Details

plots baseline cumulative hazard function, survival function for each covariate while keeping the other fixed at the mean value (using plot_survival_cox_covariates), survival function for each combination of covariate using survfit (using plot_return_survival_curve) and test for cox regression results It also returns risk relative to mean (predicted at mean value of each covariate) along with the fit results coefficients, SE of coefficients, summary, and analysis of deviance

Value

the results of the regression analysis

Examples

```
data_for_survival <- survival::aml
surv_estimated <- use_coxph_survival("status", data_for_survival, "x",
  covariates = NA, "time")

data_for_survival <- survival::lung
surv_estimated <- use_coxph_survival("status", data_for_survival, "sex",
  covariates = c("ph.ecog"), "time")
```

---

use_fh2_survival ## *Get the parameter values using the survival analysis using FH2 method*

Description

Get the parameter values using the survival analysis using FH2 method

Usage

```
use_fh2_survival(
  param_to_be_estimated,
  dataset,
  indep_var,
  covariates,
  timevar_survival
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
covariates	list of covariates
timevar_survival	time variable for survival analysis, default is NA false by default

Details

This function is for survival analysis using FH2. This plots the cumulative survival function for each combination of covariate If the covariate is numeric, R takes it as different levels. The plot uses the returned list of survfit and extracts the time and the strata from summary of the fit (implemented in plot_return_survival_curve function)

Value

the results of the regression analysis

Examples

```
data_for_survival <- survival::aml
surv_estimated <- use_fh2_survival("status", data_for_survival, "x",
  covariates = NA, "time")
```

---

use_fh_survival

Get the parameter values using the survival analysis method FH

Description

Get the parameter values using the survival analysis method FH

Usage

```
use_fh_survival(
  param_to_be_estimated,
  dataset,
  indep_var,
  covariates,
  timevar_survival
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
covariates	list of covariates
timevar_survival	time variable for survival analysis, default is NA

Details

This function is for survival analysis using FH. This plots the cumulative survival function for each combination of covariate If the covariate is numeric, R takes it as different levels. The plot uses the returned list of survfit and extracts the time and the strata from summary of the fit (implemented in plot_return_survival_curve function)

Value

the results of the regression analysis

Examples

```
data_for_survival <- survival::aml
surv_estimated <- use_fh_survival("status", data_for_survival, "x",
  covariates = NA, "time"
)
```

---

use_generalised_linear_mixed_model

Function for generalised linear mixed model

Description

Function for generalised linear mixed model

Usage

```
use_generalised_linear_mixed_model(
  param_to_be_estimated,
  dataset,
  fix_eff,
  fix_eff_interact_vars,
  random_intercept_vars,
  nested_intercept_vars_pairs,
  cross_intercept_vars_pairs,
  uncorrel_slope_intercept_pairs,
  random_slope_intercept_pairs,
  family,
  link,
  package_mixed_model
)
```

Arguments

`param_to_be_estimated`	column name of dependent variable
`dataset`	a dataframe
`fix_eff`	names of variables as fixed effect predictors
`fix_eff_interact_vars`	those of the fixed effect predictors that show interaction
`random_intercept_vars`	names of variables for random intercept
`nested_intercept_vars_pairs`	those of the random intercept variables with nested effect
`cross_intercept_vars_pairs`	those of the random intercept variables with crossed effect
`uncorrel_slope_intercept_pairs`	variables with no correlated intercepts
`random_slope_intercept_pairs`	random slopes intercept pairs - this is a list of paired variables
`family`	family of distributions for the response variable
`link`	link function for the variances
`package_mixed_model`	package to be used for mixed model

Value

result regression result with plot if success and -1, if failure

Examples

```
datafile <- system.file("extdata", "culcita_data.csv",
package = "packDAMipd")
dataset <- read.csv(datafile)
results1 = use_generalised_linear_mixed_model("predation",
dataset = datafile,fix_eff = c("ttt"), family = "binomial",
fix_eff_interact_vars = NULL, random_intercept_vars = c("block"),
nested_intercept_vars_pairs = NULL, cross_intercept_vars_pairs = NULL,
uncorrel_slope_intercept_pairs = NULL, random_slope_intercept_pairs = NULL,
 link = NA, package_mixed_model = NA)
```

---

use_generalised_linear_model

Get the parameter values using logistic regression

Description

Get the parameter values using logistic regression

Usage

```
use_generalised_linear_model(
  param_to_be_estimated,
  dataset,
  indep_var,
  family,
  covariates,
  interaction,
  naaction,
  link = NA
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
family	distribution name eg. for logistic regression -binomial
covariates	list of covariates-calculations to be done before passing
interaction	boolean value to indicate interaction in the case of linear regression
naaction	action to be taken with the missing values
link	link function if not the default for each family

Details

This function returns the results and plots after doing linear regression Requires param to be estimated, dataset, independent variables and information on covariates, and interaction variables if there are Uses form_expression_glm to create the expression as per R standard for e.g glm(y ~ x). Returns the fit result,s summary results as returned by summary(), confidence interval for fit coefficients (ci_coeff), variance covariance matrix, cholesky decomposition matrix, results from correlation test, plot of diagnostic tests and model fit assumptions, plot of model prediction diagnostic include AIC, R2, and BIC. The results of the prediction ie predicted values for fixed other variables will be returned in prediction matrix

Value

the results of the regression analysis

Examples

```
gm_result <- use_generalised_linear_model(
  param_to_be_estimated = "Direction",
  dataset = ISLR::Smarket, indep_var = "Lag1", family = "binomial",
  covariates = c("Lag2", "Lag3"),
  interaction = FALSE, naaction = "na.omit", link = NA)
```

---

use_km_survival

Get the parameter values using the Kaplan-Meier survival analysis

---

Description

Get the parameter values using the Kaplan-Meier survival analysis

Usage

```
use_km_survival(
  param_to_be_estimated,
  dataset,
  indep_var,
  covariates,
  timevar_survival
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided

indep_var the independent variable (column name in data file)

covariates list of covariates

timevar_survival
time variable for survival analysis, default is NA

Details

This function is for survival analysis using Kaplan Meier. This plots the cumulative survival function for each combination of covariate If the covariate is numeric, R takes it as different levels. The plot uses the returned list of survfit and extracts the time and the strata from summary of the fit (implemented in plot_return_survival_curve function)

Value

the results of the regression analysis, fit results, summary and plot

Examples

```
data_for_survival <- survival::aml
surv_estimated <- use_km_survival("status", data_for_survival, "x",
  covariates = NA, "time")

data_for_survival <- survival::lung
surv_estimated <- use_km_survival("status", data_for_survival, "sex",
  covariates = c("ph.ecog"), "time")
```

---

use_linear_mixed_model

Function for mixed effect regression

Description

Function for mixed effect regression

Usage

```
use_linear_mixed_model(
  param_to_be_estimated,
  dataset,
  fix_eff,
  fix_eff_interact_vars,
  random_intercept_vars,
  nested_intercept_vars_pairs,
  cross_intercept_vars_pairs,
  uncorrel_slope_intercept_pairs,
  random_slope_intercept_pairs,
  package_mixed_model
)
```

Arguments

param_to_be_estimated	column name of dependent variable
dataset	a dataframe
fix_eff	names of variables as fixed effect predictors
fix_eff_interact_vars	those of the fixed effect predictors that show interaction
random_intercept_vars	names of variables for random intercept
nested_intercept_vars_pairs	those of the random intercept variables with nested effect
cross_intercept_vars_pairs	those of the random intercept variables with crossed effect
uncorrel_slope_intercept_pairs	variables with no correlated intercepts
random_slope_intercept_pairs	random slopes intercept pairs - this is a list of paired variables
package_mixed_model	package to be used for mixed model

Value

result regression result with plot if success and -1, if failure

Examples

```
datafile <- system.file("extdata", "data_linear_mixed_model.csv",
package = "packDAMipd")
dataset = utils::read.table(datafile, header = TRUE, sep = ",",
na.strings = "NA",
dec = ".", strip.white = TRUE)
result <- use_linear_mixed_model("extro",
  dataset = dataset,
  fix_eff = c("open", "agree", "social"), fix_eff_interact_vars = NULL,
  random_intercept_vars = c("school", "class"),
  nested_intercept_vars_pairs = list(c("school", "class")),
  cross_intercept_vars_pairs = NULL, uncorrel_slope_intercept_pairs = NULL,
  random_slope_intercept_pairs = NULL, package_mixed_model = NA)
```

use_linear_regression ##
Get the parameter values using the linear regression

Description

Get the parameter values using the linear regression

Usage

```
use_linear_regression(
  param_to_be_estimated,
  dataset,
  indep_var,
  covariates,
  interaction
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
covariates	list of covariates-calculations to be done before passing
interaction	boolean value to indicate interaction in the case of linear regression, false by default

Details

This function returns the results and plots after doing linear regression Requires param to be estimated, dataset, independent variables and information on covariates, and interaction variables if there are Uses form_expression_lm to create the expression as per R standard for e.g lm(y ~ x). Returns the fit result,s summary results as returned by summary(), confidence interval for fit coefficients (ci_coeff), variance covariance matrix, cholesky decomposition matrix, Results from correlation test, plot of diagnostic tests and model fit assumptions, plot of model prediction diagnostic include AIC, R2, and BIC. The results of the prediction ie predicted values when each of covariate is fixed will be returned in prediction matrix predicted values will provide the mean value of param_to_to_estimated as calculated by the linear regression formula. ref:https://www.statmethods.net/stats/regression.html

Value

the results of the regression analysis

Examples

```
results_lm <- use_linear_regression("dist",
  dataset = cars,
  indep_var = "speed", covariates = NA, interaction = FALSE)

library(car)
results_lm <- use_linear_regression("mpg",
  dataset = mtcars,
  indep_var = "disp", covariates = c("hp", "wt", "drat"),
  interaction = FALSE)
```

---

use_parametric_survival

Get the parameter values using the survival analysis parametric survival

---

Description

Get the parameter values using the survival analysis parametric survival

Usage

```
use_parametric_survival(
  param_to_be_estimated,
  dataset,
  indep_var,
  info_distribution,
  covariates,
  timevar_survival,
  cluster_var = NA
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
info_distribution	distribution name eg. for logistic regression -binomial
covariates	list of covariates
timevar_survival	time variable for survival analysis, default is NA
cluster_var	cluster variable for survival analysis

Details

This function is the last in the layer of function for parametric survival analysis. This then returns the parameters of interest, plots the results etc if the distribution is weibull it uses the package SurvRegCensCov for easy interpretation of results Returns the fit result, summary of regression, variance-covariance matrix of coeff, cholesky decomposition, the parameters that define the assumed distribution and the plot of model prediction Using survfit from survival package to plot the survival curve R's weibull distribution is defined as std weibull in terms of a and b as (a/b) (x/b)^ (a-1) exp((-x/b)^a) where a is the shape and b is the scale In HE the weibull distribution is parameterised as bit different it is like gamma.lambda. t^(gamma-1) .exp(-lambda*t^gamma) where gamma is the shape and lambda is the scale. The relationship is as below. HE_shape = rweibull_shape HE_scale = rweibull_scale ^(-rweibull_shape) The survreg shape and scale are again bit different and they are rweibull's shape and scale as below. rweibull_shape = 1/fit$scale rweibull_scale = exp(fit intercept)= exp(fit$coefficients) remember to use 1st of coefficients This has been utilised in SurvRegCensCov::ConvertWeibull predict() for survreg object with type =quantile will provide the failure times as survival function is 1-CDF of failure time.

Value

the results of the regression analysis

Examples

```
data_for_survival <- survival::lung
surv_estimated <- use_parametric_survival("status",
data_for_survival, "sex", info_distribution = "weibull",
covariates = c("ph.ecog"), "time")
```

---

use_seemingly_unrelated_regression

Bivariate regression for correlated observations

Description

Bivariate regression for correlated observations

Usage

```
use_seemingly_unrelated_regression(
  param1_to_be_estimated,
  param2_to_be_estimated,
  dataset,
  indep_var,
  covariates1,
  covariates2,
  interaction1,
  interaction2
)
```

Arguments

param1_to_be_estimated	parameter of interest
param2_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
covariates1	list of covariates - for equation 1
covariates2	list of covariates - for equation 2
interaction1	boolean value to indicate interaction - for equation 1
interaction2	boolean value to indicate interaction - for equation 2 false by default

Value

the results of the regression analysis

Examples

```
datafile <- system.file("extdata", "sureg_data.csv", package = "packDAMipd")
dataset <- read.csv(datafile, stringsAsFactors = TRUE)
results_sureg <- use_seemingly_unrelated_regression("read", "math",
  dataset = dataset,
  indep_var = "female", covariates1 = c("as.numeric(ses)", "socst"),
  covariates2 = c("as.numeric(ses)", "science"), interaction1 = FALSE,
  interaction2 = FALSE
)
```

---

use_survival_analysis

Get the parameter values using the survival analysis

Description

Get the parameter values using the survival analysis

Usage

```
use_survival_analysis(
  param_to_be_estimated,
  dataset,
  indep_var,
  info_get_method,
  info_distribution,
  covariates,
```

```
  timevar_survival,
  cluster_var = NA
)
```

Arguments

param_to_be_estimated	parameter of interest
dataset	data set to be provided
indep_var	the independent variable (column name in data file)
info_get_method	additional information on methods e.g Kaplan-Meier ot hazard
info_distribution	distribution name eg. for logistic regression -binomial
covariates	list of covariates - calculations to be done before passing
timevar_survival	time variable for survival analysis, default is NA
cluster_var	cluster variable for survival analysis

Details

This function helps to get the parameter values after the survival analysis Takes into account many different methods like KM.FH, Cox proportional etc. and then calls appropriate functions to do the survival analysis

Value

the results of the regression analysis

Examples

```
data_for_survival <- survival::aml
surv_estimated_aml <- use_survival_analysis("status", data_for_survival,
  "x",
  info_get_method = "parametric", info_distribution = "weibull",
  covariates = NA, "time")
```

---

utility_data.df *utility matrix*

Description

utility matrix

Usage

```
utility_data.df
```

Format

A 11 by 2 dataframe

Source

created on Nov 26, 2019 from tmat <- rbind(c(1, 2), c(3, 4)) colnames(tmat) <- rownames(tmat) <- c("Healthy", "Dead") tm <- transition_matrix(2, tmat, c(0.5, 0.5, 0, 1)) a <- health_state("Healthy", 1, 1, FALSE) b <- health_state("Dead", 1, 0, TRUE) health_states <- combine_state(a, b) this.strategy <- strategy(tm, health_states, "intervention")

---

value_ADL_scores_IPD *Function to convert ADL scores to a T score*

Description

Function to convert ADL scores to a T score

Usage

```
value_ADL_scores_IPD(
  ind_part_data,
  adl_related_words,
  adl_nrcode,
  adl_scoring_table = NULL
)
```

Arguments

ind_part_data	a data frame containing IPD data
adl_related_words	related words to find out which columns contain adl data
adl_nrcode	non response code for ADL
adl_scoring_table	ADL scoring table, if given as NULL use the default one

Value

ADL scores converted to T score included modified data, if success -1, if failure

Examples

```
datafile <- system.file("extdata", "trial_data.csv", package = "packDAMipd")
trial_data <- load_trial_data(datafile)
value_ADL_scores_IPD(trial_data,c("tpi"), NA, adl_scoring_table = NULL)
```

value_eq5d3L_IPD *Function to add EQ5D3L scores to IPD data*

Description

Function to add EQ5D3L scores to IPD data

Usage

```
value_eq5d3L_IPD(ind_part_data, eq5d_nrcode)
```

Arguments

ind_part_data	a dataframe
eq5d_nrcode	non response code for EQ5D3L, default is NA

Value

qaly included modified data, if success -1, if failure

Source

http://eprints.whiterose.ac.uk/121473/1/Devlin_et_al-2017-Health_Economics.pdf

Examples

```
datafile <- system.file("extdata", "trial_data.csv", package = "packDAMipd")
trial_data <- load_trial_data(datafile)
value_eq5d5L_IPD(trial_data, NA)
```

value_eq5d5L_IPD *Function to add EQ5D5L scores to IPD data*

Description

Function to add EQ5D5L scores to IPD data

Usage

```
value_eq5d5L_IPD(ind_part_data, eq5d_nrcode)
```

Arguments

ind_part_data	a dataframe
eq5d_nrcode	non response code for EQ5D5L, default is NA

Value

qaly included modified data, if success -1, if failure

Source

http://eprints.whiterose.ac.uk/121473/1/Devlin_et_al-2017-Health_Economics.pdf

Examples

```
datafile <- system.file("extdata", "trial_data.csv", package = "packDAMipd")
trial_data <- load_trial_data(datafile)
value_eq5d5L_IPD(trial_data, NA)
```

---

value_promis3a_scores_IPD

Function to convert promis3a scores to a T score

Description

Function to convert promis3a scores to a T score

Usage

```
value_promis3a_scores_IPD(
  ind_part_data,
  promis3a_related_words,
  promis3a_nrcode,
  promis3a_scoring_table = NULL
)
```

Arguments

ind_part_data	a data frame containing IPD data
promis3a_related_words	related words to find out which columns contain promis3a data
promis3a_nrcode	non response code for promis3a
promis3a_scoring_table	promis3a scoring table, if given as NULL use the default one

Value

promis3a scores converted to T score included modified data, if success -1, if failure

Examples

```
trial_data <- data.frame("tpi.q1" = c(1, 2),
"tpi.q2" = c(1, 2), "tpi.q3" = c(1, 2))
results <- value_promis3a_scores_IPD(trial_data, c("tpi"), NA, NULL)
```

value_Shows_IPD *Function to estimate the cost of tablets taken (from IPD)*

Description

Function to estimate the cost of tablets taken (from IPD)

Usage

```
value_Shows_IPD(ind_part_data, shows_related_words, shows_nrcode)
```

Arguments

ind_part_data	a data frame containing IPD
shows_related_words	a data frame containing IPD
shows_nrcode	non response code for ADL, default is NA

Value

sum of scores, if success -1, if failure

Examples

```
datafile <- system.file("extdata", "trial_data.csv", package = "packDAMipd")
trial_data <- load_trial_data(datafile)
value_Shows_IPD(trial_data, "qsy", NA)
```

word2num *Function to check the variable null or NA*

Description

Function to check the variable null or NA

Usage

```
word2num(word)
```

Arguments

word	word for the number

Details

https://stackoverflow.com/questions/18332463/convert-written-number-to-number-in-r

Value

return the number

Examples

```
answer <- word2num("one forty one")
answer <- word2num("forty one and five hundred")
answer <- word2num("five thousand two hundred and eight")
```
